EXTRACT

*From an Act prescribing Rules for the Government of the State Library,
passed March 8th, 1861.*

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned: and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof: and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

Circular.
San Francisco Mining Share-
holders' Directory.
Stock Prices—Bid and Asked.

The New Year.

Another year has dawned upon us, and the sound of the parting gun of 1867 is still ringing in our ears. How few, in the great circuit of the earth, realize that as each New Year comes and passes, another year is stricken from their term of existence, and that ere many more shall have passed, they will each have gone the last long journey. Yet so it is. We usher in the New Year with joy; our business affairs hurry us along through the intervening months, year by year, until we find the silver in our hair, the crow's-feet in our eyes, and the wrinkles in our face. Still we stop not to think, but plunge along regardless of all else save the accumulation of "money that enriches not." The poor miner, browed in summer by the sun's fierce rays, and chilled and cramped by frequent contact with Boreas and the chilly waters of the mountains in mid-winter, spends his years vainly, in an attempt to procure at "one fell swoop," that wealth which others are content to gather by small degrees. The end generally proves good the old saying, that "slow and steady wins the race."

Yet all hail to the hardy miner! Without him California would still have been a dreary waste, and our beautiful valleys, with their now pleasant homes, would have still lain idle for want of a sufficient incentive to cause the farmers to locate in them. We might go back to the days of '48, and remind the reader how, when first the discovery of gold in our State was shouted throughout the nation and the world, the young, the middle-aged and the veteran, rushed to the gulches in our mountains, and how each year since, the golden stream has flowed from our borders and enriched the world, and California has grown to be a giant State. Far removed from her Eastern sisters, she overlooks the waters that trend to the setting sun, and wields an influence which at once makes her the star of the Union. But a new era is about to dawn; ere long the iron horse will be neighing on "the western slope," and his tread across our interior valleys and plains will bring with it new life to our State, and our people will be brought in close communion with the far East. Then truly will our motto shine forth in its appropriate fullness of import—EUREKA!

Devon's Improved Scaffold for Plasterers, Painters, etc.

It is often necessary to raise scaffolds by the sides of buildings for the purpose of re-

frames, then passing over an intermediate block in the center hooking-frame, and then descending, are fastened to the barrel of the windlass, E, and are thus operated in unison by the workmen turning the winch, which

DEVON'S IMPROVED SCAFFOLD FOR PAINTERS, PLASTERERS, ETC.

pairing, painting, stuccoing, etc., and it is sometimes found, where the repairs are not of serious moment, that the preliminary preparations and expense of erecting scaffolds upon the old-fashioned plans involved a greater cost than the repairs themselves. The improved scaffold that we represent is equally applicable to all the purposes mentioned, as well as any kind of labor that is required to be executed upon the walls of a house or other building. A great merit of this scaffold is, that it is light and portable, and can be easily put in place and readily elevated and lowered by a single individual, thus dispensing with the additional help of three or four persons that are required in the elevation of the old style of scaffold.

Fig. 1 represents the improvement, and the method of operating it by means of a winch and proper tackle. A is the platform on which the workman operates in performing the necessary labor. At each end of this platform are fastened iron hails, to which sheaves or blocks, with appropriate ropes, B, are attached, the ropes passing over other blocks fastened to the overhead hooking-

is held in place and prevented from unwinding by the pawl, e, catching into the ratchet-wheel upon the barrel of the windlass. The rope, G, is held in place upon the outer edge of the scaffold by iron standards, and affords greater security to the workman by preventing him from incautiously stepping off the platform through forgetfulness or carelessness.

The platform is held by the hooking-frames, C, Fig. 2, to which the pulleys by which it is raised and lowered are attached. These frames are supported by oblique braces, c, that are fastened to the horizontal bar of the frame and rest against the walls of the building, and are further strengthened by an iron rod that passes through both brace and bar. These bars pass over the window-sill and to the inside of the building, and are held in place by passing through a mortise in a vertical board, D, which is kept in place by a nail passing through the metal foot and being inserted slightly in the floor. The bar, C, is confined in place in the mortise of the board, D, by a pin that is inserted in one of the holes, d, after the bar is passed through the mortise. To accommodate it to the various thicknesses of the walls, a series of these pin holes are made, as shown at d, d. To avoid injury to the window-sills, a recess is made in the vertical board at the proper heights, in which the protruding portion of the sill enters.

As a security against the tipping over of the platform, by accident or unequal distribution of weight or material upon it, two braces, F, Figs. 1 and 2, are fastened to the side that rests against the building, and also answer the additional purpose of keeping the edge of the scaffold from coming in contact with and injuring the fronts of the window-frames and ornaments in the elevating and lowering of it.

As the scaffold cannot be elevated above the hooking-braces, and, consequently, not above the window-sills, of the upper story of the house, and in order to enable the workman to gain access to the more elevated parts of the building, a temporary platform is laid upon the hooking-frames that support the movable scaffold, and to gain further access to portions of the building that are still beyond the reach of the workman, a series of trestles are placed upon this temporary scaffold and an additional platform made upon the trestles, which arrangement can be repeated until the desired elevation is attained.

This improved scaffold is the invention of William A. Devon, of Port Richmond, N. Y., and was first described and illustrated in the *American Artisan* of Dec. 9, 1866.

HORSE RAILWAYS, within a few years, have become a most important feature in human locomotion in this country. It is estimated that, great as is the travel on the principal American steam railroads, that on our city horse railroads is immensely in excess. It is calculated that where 6,000 persons are transported on the former, 60,000 travel on the latter.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER SEVEN.

NOTE.—In the last paper it was observed that in place of a saturated solution of salt being soluble, like water, of absorbing double its volume of chlorine, that this property was diminished by one-third, and that certain future calculations were based thereon. It was omitted to state, however, that at a temperature of 131 deg. this property was still further reduced until the brine was not capable of retaining more than its own volume of gas, and the calculations immediately succeeding, were based on the latter.

SOLUBILITY OF SILVER IN COMBINATION WITH BRINE.

The capacity of an aqueous solution of chlorine for dissolving gold, increases from the boiling point down to about 48°; on the other hand, the action of a saturated solution of common salt in dissolving chloride of silver increases from the freezing point (32°), at which scarcely a perceptible trace is dissolved, up to the boiling point, (212°). At 50°, of the weight of common salt present in the solution, only 0.0017 part of chloride of silver is dissolved, which capacity is increased to 0.0068 at 212°. The solubility of common salt is very little affected at temperatures ranging between 32° and 212°, about 27 per cent. being susceptible of solution between those two points; 26, however, has been taken as the basis of several succeeding calculations, which, for a ton of water would amount to 520 pounds, an allowance sufficiently large, as will be seen by the succeeding quotation from

RIVOT'S ACCOUNT OF AUGUSTIN'S METHOD, in which the amount of salt in solution is not estimated at more than 22 per cent :

"About 500 kilogrammes (1,102 lbs) of the roasted and chloridized mattes while still hot, are placed in each of the dissolving tubs, which are arranged in line on an upper floor or raised platform. A solution of common salt, containing from 20 to 22 per cent. of salt, and heated to 131° Fb. by the aid of steam, is then thrown in from a trough which extends above. When the tubs are nearly full the supply is stopped, and the faucets at the bottom of the tubs are opened so as to allow a part only of the liquid to run off. When the depth of the solution above the matte is reduced to .0m .12 or .0m .15 (4 to 5 inches), the faucets are closed, and the whole is left undisturbed for one hour. These first manipulations are intended to thoroughly impregnate the mattes with the saline solution, and to dissolve out the greater part of the chlorides. The faucets are afterwards reopened, and all the liquid in the vats is allowed to run off. In order to complete the solution of the chloride of silver, and to wash the materials, a stream of solution of salt is allowed to run through the tubs for twenty hours without interruption, the faucets of discharge and supply being so adjusted that the mattes are kept constantly covered with the liquid to a very slight depth.

In order to better distribute the solution throughout the mattes, a disk of wood pierced with small holes, is placed upon the surface of the matte. It is estimated that six cubic metres in volume of saline solution are required to flow through each tub in order to dissolve and carry off the whole of the chloride of silver contained in the five hundred kilogrammes (1,102 lbs.) of matte. It may be ascertained when the washing is complete by receiving a portion of the liquid which runs from the faucet in a capsule, and plunging into it a well cleaned plate of copper; if there is no deposit of metal upon the surface, the washing may be regarded as complete. If, on the contrary, a film of silver is precipitated, the saline solution is allowed to run through the tub until, by a new trial, it is found that a metallic precipitate is no longer found upon the copper."

A cubic metre is equal to 35 cubic feet and a fraction, six of which, dismissing the fraction, would therefore amount to 210 cubic feet, or 6,562 tons (13,125 lbs.) which would suffice to hold in solution at 20 per cent. (2,625 lbs.) salt at 25 per cent.; 3,281 lbs. do., forming totals of 15,750 and 16,406 lbs., respectively, the weight of the solution required being thus from fourteen times greater in the one case, and fifteen in the other, than the weight of matte to which the solution would be applied. The present will be an appropriate place for explaining what I intended to convey in a former paper by what was termed "one operation," by which expression I intended, though not so explained, to convey what I conceived would be the commonly accepted meaning of the term, rather than as being confined to a strictly technical definition, which latter would be more comprehensive than the ordinary impression made by it on the great bulk of readers, who would conceive, generally, that by "one operation," little more would be meant than leaching the chloride of silver from the prepared matte by an amount of brine not more than sufficient to cover the matte to the depth of three or four inches, and two or three subsequent sprinklings, sufficient to wash out what had not been completely drained in the first instance, the latter being a circumstance that will always be required. It would never be imagined by ordinary readers that by one operation was meant a continuous supply of brine for twenty hours. In place, however, of such a very limited amount of brine, only, being required, the above quoted account by Rivot of Augustin's method, shows that no less than fourteen times the weight of brine, containing 20 per cent. of salt, is required at a temperature of 131°, in order to effectually leach out the chloride of silver present in the chloridized mattes of Mansfeld when they undergo this mode of treatment. It has already been explained that such mattes contain from eighty to one hundred and twenty dollars worth of silver per ton; if \$100 is accepted as the average, that sum will be above, rather than below the mark; which sum has now been adopted as approaching sufficiently near enough to the truth for illustrative purposes, and at the same time forms a convenient one for calculation.

Taking the data furnished by Rivot, it will be found that six cubic metres of water holding 20 per cent. of its weight of salt in solution, will give for the latter 2,265 lbs., now, as the soluble power of brine increases on the amount of salt in solution from .0017 at 50° to .0068 at 212°, it will not vary greatly from the truth to calculate the solubility of chloride of silver in such brine at .004. If the last statement is correct, and it cannot be very far from being so, brine of the quantity, quality and temperature under notice, would theoretically suffice to dissolve ten and a half pounds avoirdupois of chloride of silver, or 153 troy ounces. As 144 of chloride of silver is equivalent to 103 of metallic silver, it follows that 115.4 ounces of the latter ought to be present in the 153 ounces of the former, which might, theoretically, be leached out by such a solution of salt, and would be worth, at \$1.30 per ounce, \$153.62, or more than fifty per cent. above the value of the silver estimated as present in the Mansfeld mattes. At the first blush it will probably appear to one inexperienced in such matters, that a very wasteful method must be pursued in employing so large an excess of solution than what is theoretically required. The explanation is simple; the data previously given respecting the solubility of chloride of silver in solutions of common salt, are based upon experiments made with precipitated chloride of silver, the solubility of which is much greater than when formed in the dry way, or when found in the state of natural chloride, the two last named varieties being invariably much less soluble with all its solvents, whether ammoniacal, hyposulphites or alkaline chlorides, than when the same is formed by precipitation from solution; consequently more brine is required in order to dissolve out the chloridized silver contained in the matte.

In fact, practice has shown that the silver chloride formed becomes proportionally more insoluble in the exact ratio of the time occupied in the chlorination and the elevated character of the temperature to which the matte or ore may have been exposed; both are evils to be avoided, and causes the chlorinating roasting to be one of far greater nicety than is generally imagined. The evil just pointed out is not found so injurious (though still so in degree,) when amalgamation is the ultimate mode employed, because in the latter case a chemical, and I may therefore say, a galvanic action takes place between the iron or other metal employed to dechlorinate the silver present, which, to a considerable extent, neutralizes the ill effects so caused.

THE INCONVENIENT FEATURES OF THE BRINE METHOD WHEN APPLIED TO THE BENEFICIATION OF ORES CONTAINING ONLY SILVER.

One of the chief objections to the brine method must be apparent to the merest tyro, viz: the extraordinary amount of brine required to exhaust the chloride of silver, from any given quantity of ore, amounting, as above shown, on an ore of one hundred dollars value to not less than fourteen times the weight of the ore treated, even when the solution contains, of common salt, one-fifth in weight of the water present, and at a temperature of 131°. The value of the salt required as stock would be a considerable item, although, like mercury, the same material can be to a large extent employed repeatedly, to effect which, however, a certain cost for the power employed to raise the dechlorized brine into the boiler, where it would be reheated and concentrated, if necessary, prevails to again flowing by gravitation, over the same or fresh matte, in order to resume its soluble functions. The maintenance of a considerable part of such a mass of solution, as above noticed, partly at a boiling temperature, for the purpose of maintaining the contents of the lixivating vats at 131°, which, during the winter season in Nevada, would probably also require the accession of steam, would, where fuel is so expensive, form a not inconsiderable item. In addition, however, to the preceding, the mode to be adopted in concentrating the chloride from the solution has to be borne in mind.

Two modes can, and has heretofore been adopted; one consists in diluting and cooling the hot solution with water, by which means the greater part of the chloride of silver becomes precipitated. This mode, however, possesses the defect of requiring the subsequent evaporation of the diluting water, and consequently not adapted for the Sierra Nevada, in fact has been abandoned in Saxony, and the precipitation of the silver by means of some metal (copper,) generally is employed, in which case the latter metal is again recovered by precipitation by means of iron; the cement copper so obtained can subsequently be employed for the precipitation of silver in future lixivating, or if obtained more than such requirements demand, as occasionally occurs when the ores contain copper also, the excess can be melted into ingots as copper of the very best quality.

To the above I may add a third, which suggested itself while occupied in writing this series, respecting which I have thrown out a hint previously. As at 32° (freezing point,) brine does not retain chloride of silver in solution, the compound, therefore, could be precipitated by exposing a hot saturated solution to the low temperature named, and the freed brine at once pumped up to the boiler for future use.

In order to enable parties, so disposed, to make their own calculations of the benefits derivable from the hot brine method of lixivating chloride of silver, I will insert a few brief memoranda of the theoretic proportions soluble in given quantities at the temperatures of 50° and 212°. If 260 pounds of salt is dissolved in 1,000 pounds water at 50°, 0.442 pounds chloride of silver, or 6.4 troy ounces will be held in solution, but at 212° that amount would be increased to 1,768 pounds, or 25,783 ounces troy, these would be equivalent to 4.8 ounces of metallic silver in the first case, and 19.2 ounces in the latter, and in money value to \$6.44 in the former, and \$25.96 in the latter; in practice, however, it will be found that three or four times the quantity named as the soluble power, theoretically, would be required under the most careful and skillful management.

GOLD IN RUSSIAN ASIA.—The Shanghai News Letter, received by the China, has the following in reference to an alleged important gold discovery in Russian Asia:

"We are informed by a gentleman now in town, and lately from Passiet, that extensive gold mines have been discovered on Termination Island, about 20 miles from Port May, in Russian Siberia. Our informant has seen specimens of the ore, and pronounces the whole country particularly rich in gold. The Russians, however, are very jealous, and had driven away a party of some 600 Chinamen who were mining there. The gold is said to be found in rotten quartz, and also in surface diggings."

It is a fact, known to but few, that over forty million gallons of sorghum syrup are made in this country annually.

SOURCE OF THE FERTILITY OF THE NILE. The remarkable fertility of the waters of the Nile, in Egypt, was said by Humboldt to be caused by slime, the product of fish.

On the Amount of Chlorine Gas in a Hot Solution of Common Salt.

BY DR. LANSZWEERT.

EDITORS PRESS:—Prof. Rowlandson admits, in his article published in the MINING AND SCIENTIFIC PRESS, December 28th, "that the maximum absorption of chlorine by water takes place at a temperature of about 48° Fah., from which, up to the boiling point (212°), this absorption property gradually diminishes, as the temperature increases, so that when boiling heat is reached, it may be regarded as nil." In his article published in your paper of December 7th, he states that "it has been proposed to obtain gold and silver by the same operation, when employing Augustin's mode, by impregnating the hot solution with chlorine, which, it has been asserted, would have the effect of dissolving the gold present, also." In that article, no reference was made to the calorific degree of the hot solution to be used; it is only in his article of December 28th, that he names 131° Fah. as the temperature assigned by Rivot. We are thus to infer that the Professor means, by hot solution, a solution of 131° Fah.

Now, without the least danger of being scalded by such a solution, or of being offended by his petulant remarks, I do not see that his article has given me the information asked for. One volume of water, at the ordinary atmospheric temperature, absorbs two volumes of chlorine gas; and as one cubic inch of water, at 62° Fah., weighs 252.45 grains, and one cubic inch of chlorine, at the same temperature, weighs 0.766 grains, 30 fluid ounces of water (14,400 grains) will require two volumes, or 60 fluid ounces of chlorine (87.4 grains) for its saturation; or one ounce of water at 62° Fah. will take up only about three grains of chlorine.

Then, if one ounce of water, at 62° Fah., holds only three grains of chlorine, what quantity will it hold at 131° Fah.?

The Professor gives 131° Fah. as the temperature of the lixiviating solution; but there is another point to be taken into consideration, viz: that this solution is poured on the roasted ores still warm (*encore chaudes*, Rivot) from the furnace. That still warm, at least if in excess of 131° Fah., must necessarily increase the temperature of the solutions, and further diminish the amount of chlorine, if any is held in solution at this increased temperature.

The reason for lixiviating the ores, still warm, is based on the fact, first noticed by Wetzler (who recorded it simply for its scientific value), that the amount of chloride of silver which brine will take up, depends upon the quantity of salt present, and the temperature of said brine. Thus, brine at 32° dissolves only an almost insensible amount of chloride of silver; at 50°, 0.0017 of the weight of common salt present will be taken up, while at 212°, its capacity has increased to 0.0068 of the salt in the brine.

Referring again to the Professor's article of December 7th, he says, in speaking about the hot salt solution with chlorine, "I have no knowledge how far any practical results have followed from the above suggestions," and again, in the same article, under the caption of "An Episode": "With the exception of a case, which will shortly be alluded to, I had not received any information, prior to the appearance of the above notice by Mr. Kustel, that chlorine, in association with a solution of common salt, had ever been employed on a working scale for separating gold and silver from their ores at one and the same time. * * Though I suspected that something of the kind might have been done at St. Helens, Lancashire, England, about sixteen years ago!" Of course, *Albion* all over. It is quite curious, if not somewhat difficult, to follow the Professor's digressions about brine; he states, furthermore, "I am induced to believe that brine, impregnated with chlorine, or containing some compound which would evolve that gas, was employed in the process at St. Helens, and renders it quite probable that it is from that establishment that this method first emanated. I have been led to this opinion, since Mr. Kustel has stated that Von Patern and Roeszner have adopted this method."

In conclusion, I have only to again reiterate my query of the 14th ult. as to the quantity of chlorine which may be retained in a hot solution of salt, with which to treat that class of ores containing an argentiferous gold alloy, as described in my article of that date.

Mechanical.

Band Saws.

The endless or band saw has not heretofore received that attention from American mechanics, which its merits deserve; although in England it has long been quite extensively used for wood work, and has more recently been employed on iron, particularly for locomotive work. As there may be some of our readers who have not met with a saw of this kind, we will proceed to describe an American invention, which was exhibited at the late fair of the American Institute, and subsequently illustrated and described in the *Scientific American*.

The saw is operated in connection with a table, as is usual with small circular and reciprocating saws. The band saw, as its name implies, works through this table by being passed over two pulleys of equal diameters, the one over-head and the other underneath the table, precisely like an ordinary band or belt. The saw, of course, cuts continuously, the same as a circular saw, but makes a constant down stroke. The work to be presented to the saw is placed upon the table, directly beneath a guide, which keeps the saw steadily in place, and which drops down on a rigid support from the ceiling or frame work overhead. This guide is readily adjustable, as is also the upper pulley, over which the saw passes, and by which the saw may be tightened, when, by expansion or otherwise, it becomes slackened. The faces of the pulleys are covered with vulcanized rubber, resting on a bedding of strong cloth, by which a sufficient adhesion is given to the same to screen its action as a belt, without slipping. The pulleys are moreover made with flanges, like railroad wheels, so that when the work is pressed against the teeth of the saw, it is kept in position on the pulleys by its back bearing against these flanges. The saw cannot therefore be pressed off the pulleys, as a belt running on ordinary pulleys would be by pressing against its edge. It is also secured against any possibility of running off from the front of the pulleys, to the danger of the operator.

The ends of the saw are joined by means of silver solder, used in connection with a clamp, made especially for the purpose. The original temper of the plate is not affected by the process of soldering, and there is no more danger of its parting at the point of junction, than at any other portion of its length.

The great advantage claimed for the band saw over the reciprocating saw, so extensively used on work where the circular saw is inapplicable, there is no lost time in its operation; and no effort is required to keep the work on the table, as that is done by the action of the saw itself. Neither is there any need of appliances or effort of any kind to clear away the sawdust from the top of the table as the work progresses, as all the dust is carried downwards, as with the circular saw.

The saw exhibited at the Institute, was claimed to run at the rate of 4,000 feet per minute; and it is said to have been proved by actual experiment, that it was capable of doing four times as much work, in a given time, as could be done with a reciprocating saw. Its work was moreover done very smoothly, and required less labor in finishing than when done by the reciprocating saw. It was pronounced by competent judges, to be a very simple and economical machine. It has recently been patented by Messrs. First and Prybil, 175 Hester street, New York city. In the machine alluded to, both the pulleys, as well as the table and all the other appliances, are connected with a single iron frame, so that it may be readily moved and set up whenever needed. The driving pulleys are placed upon the axle of the lower band pulley, which works under the table.

TESTS OF RANSOM'S PATENT STONE under the British Government, at Bombay, have been made, and, though under very unfavorable conditions as regards the supply of proper material, molds and knowledge of the manipulation, have resulted in a very favorable report.

A STEAM BUGGY has been running with success, for some time past, on the roads about Boston. It attains considerable speed, and appears to be light and entirely under control of the driver.

Rolling Heavy Armor Plates.

We made mention a week or two since of the rolling at the Atlas Iron Works in England, of an immense armor plate, twenty feet long by four wide, and fifteen inches thick. The process of rolling was minutely described, but not the preparatory process of heating.

It appears that one of the greatest difficulties in rolling such immense masses of iron, so as to effect a perfect welding throughout (without which the plates are of but little practical use), is to obtain a good and uniform heat among the several slabs of which the single plate is subsequently formed—that is, a heat which shall penetrate to the center of the mass, and thereby secure the perfect weld desirable, without being so great and long continued as to partially fuse the upper layers. This difficulty is most ingeniously overcome at the Atlas Works in the following manner:

Between each layer of slabs a number of cubes of highly carbonized iron, about one inch square, are placed, so as to keep each slab apart from the others. This allows the whole mass of flame and heat to circulate between them, so that all the slabs attain the same degree of heat at almost the same time. As the intense ardency of the furnace increases, these cubes are gradually melted. In the act of melting, they restore, to a certain degree, the carbon which has been burnt out of the slabs by the previous process, and as they melt, allow each slab to settle down; when, like a cement, their melted metals form a perfect weld. It is not till this has been effected, and the new perfect plate is heated to an almost blinding whiteness, that the mass is withdrawn from the furnace to be rolled.

The plate referred to was pronounced sound and perfect by good judges; but it was to be thoroughly tested by being cut, and possibly submitted to the mere practical trial of being brought under the fire of Palliser shot from a 9-inch gun. This plate was turned out from the same furnace and molds as those employed for making the ordinary $4\frac{1}{2}$ and 9-inch plates; so that no new mechanical appliances have been brought to bear in accomplishing this great feat of iron work. Such plates have not been heretofore rolled, because there is no call for them, for the simple reason that no ship yet built, could carry such an armor; but it is now possible that they may be employed in casing forts, where weight of metal is no objection—cost and resistance being the only considerations to be taken into account. There are some three or four rolling mills in England that are capable of turning out the same size of plates. Indeed the Cyclop Works had already turned out a sample plate 14 inches thick; only one inch less than the one which has furnished the text for this paragraph.

AN IMMENSE CASTING.—We find in *Engineering*, the following interesting account: Not long since, Sir John Brown & Co., of the Atlas Works, Sheffield, required an accumulator cylinder 36 feet in length. The outer diameter was 36 inches, the inner 26 inches, for a 24-inch ram, and the total weight was to be about 25 tons. Several makers tendered for the casting, in four nine feet lengths; but Messrs. Tannet, Walker & Co., successfully undertook to cast it in one. They dug a pit in their foundry floor 34 feet deep, and built up a mold in strong cast iron boxes, carefully jointed together. The casting was poured so that the lower half rose from the bottom, the upper half being afterwards poured from the top. The ferrostatic head of a column of iron thirty-six feet high is about one hundred weight per square inch; so that the mold had to be very strong. The iron, before entering at the bottom, fell upon a wrought iron plate, which broke the shock of the fall and secured the steady rise of the metal in the mold. This remarkable work may be compared, with some reason, to a cast iron gun 36 feet long and of 26 inch bore—a gun heavier than the 15-inch Rodman. The casting was completely successful, and the cylinder is now in use at the Atlas Works.

Scientific Miscellany.

Modern Scientific Investigation.

The address of Prof. J. S. Newberry before the recent session of the American Association for the Advancement of Science, as published in the *American Naturalist*, is a very interesting and suggestive publication. His subject was "The Method and Tendencies of Modern Scientific Investigation." The lecturer, in admitting the fact and utility of the modern spirit of scientific "progress," alluded as follows to the present increase of skepticism growing out of such investigations: "In view of the ruthlessness with which the man of the present removes ancient landmarks, and profanes shrines hallowed by the faith of centuries, it is not surprising that many of the good and wise among us should deplore a liberty of thought, leading in their view inevitably to license; and men in over this wide-spread skepticism as an evil and insensible disease that has fallen upon the minds and hearts of men." The speaker then proceeded to give a brief analysis of this modern lack of faith, in which he throws out much encouragement to those who take a despondent view of the possible effects of the investigations and discussions which occupy so large a portion of the time and thought of the men of science of the present day, and asserts that, for himself, he is far from sharing the general alarm which it excites in the minds of many good men.

He presented a gloomy picture of the low moral and social condition into which the world fell, from the height of Grecian and Roman civilization, to that which existed some 400 years ago; and drew much encouragement from the fact that out of that chaos of darkness has grown, as if by magic, all our modern civilization, with its individual liberty and dignity; all our civil and religious freedom; our philanthropy and benevolence; our diffused comfort and luxury; our good morals and improved manners, and all the splendid achievements of modern scientific investigation.

The speaker took a brief review of the origin and progress of science. In *metaphysics* he thinks but little progress has been made. The metaphysicians of the present day are still debating the same questions which divided the rival schools of Greece, and with as little harmony of opinion as was manifested when these intangible problems absorbed the great minds of Plato and Aristotle.

With regard to *physical sciences*, with the exception of astronomy, no one had an existence previous to the time of Bacon. There was much in earlier times that was called science; but it constituted far more error than truth. The weeding out of this mass of error by the earlier modern scientists, was a far more difficult task than that of clearing the Augean stables. In accomplishing this work on the rigid, philosophical basis necessarily adopted, it was inevitable that the investigations should have been narrow and materialistic in their tendency. In this process, all that was contrary to nature, (supernatural or spiritual) was carefully excluded on the ground that the mathematical or logical faculty of the human mind was capable of solving all the problems of the universe.

The most modern inquiries, however, have fully demonstrated the fallacy of this position. To illustrate: We cannot conceive of the beginning or end of time, nor the idea of illimitable space. Yet we all admit the one must have had a beginning or otherwise; while the other must be either limited or limitless. We cannot conceive of the limits of space; or, if we bound it, we immediately seek to fill the void beyond. Such considerations bring us face to face with infinity; and we are compelled to recognize the fact that the infinite exists without the power to comprehend it, mathematically or logically. When forced to such an admission, nothing but perverseness can shut out the acknowledgement of Divine intelligence.

The speaker, in this relation, most appropriately remarks: "It seems to me that, in

the reach and thoroughness of this material investigation, we may hope for such demonstration of the reality of things immaterial as shall produce a deeper and more universal faith than has ever yet prevailed.

Through this very spirit of skepticism which prevades the modern sciences, we are compelled to exhaust all material means before we can have recourse to the supernatural. When, however, that is done, and men have tried patiently and laboriously, *but in vain*, to refer all natural phenomena to material causes, then, having proved a negative, they will be compelled to accept the existence of truth not reached by the touchstone, and *faith* will be recognized as the highest and best knowledge. * * *

"Already," as it seems to me, scientists have reached the walls of adamant—the insurmountable—that surrounds them on every side, and, ere long, we may expect to see them return to that heap of chaff from which the germs of modern science were winnowed, with the conviction that there were left buried other germs, of other and higher truths than they gleaned; truths without which human knowledge must be a dwarfed and deformed thing."

We regret that we are unable, for want of space, to give more extended extracts from this most interesting address.

ATOMS AND MOLECULES.—The distinction between *atoms* and *molecules* is invested with considerable significance; the former being applied to that amount of an element which is represented by its atomic weight, and the latter to the smallest amount which can exist in an uncombined state. It is found, for example, that the molecule of hydrogen, oxygen and chlorine, consists of two atoms of each element, and it is accordingly termed a diatomic molecule. The molecules of bromine, iodine, fluorine, nitrogen, sulphur and selenium, consist likewise of two atoms, or are diatomic. The molecules of mercury, cadmium and zinc contain but one atom, and are accordingly termed *monatomic*. The molecule of oxygen, in the condition of ozone, is *triatomic*. Phosphorus and arsenic, *tetrameric*, and sulphur, to which, as well as to oxygen, two distinct molecular weights are accorded, is *hexatomic*.

"ATOMICITY OF ELEMENTS" is a new term in chemistry, by which is meant, the relative powers of the atoms of different elements to combine with, or displace from combinations, the atoms of other elements. It is also called their atom-fixing and atom-displacing power, or their *quantivalence*. One atom of chlorine, for example, is equivalent to one atom of hydrogen, since it can be substituted for it in combination. The atomicity of chlorine or its quantivalence, is therefore taken as one, and chlorine and other elements, like fluorine, bromine, potassium, silver, having also an atomicity of one, are called *monads*. In like manner, one atom of oxygen or zinc can be substituted for two atoms of hydrogen, one atom of boron for three atoms of hydrogen, one atom of carbon for four, one of nitrogen for five, and one atom of sulphur for no less than six atoms of hydrogen.

BENEFICIAL EFFECTS OF THE POISON OF BEES, WASPS AND FISHES.—Dr. Teliupe P. Desmarter, a French savant, has been experimenting upon insects, fishes, etc., and has ascertained that the poisonous matter contained in wasps and bees, being insulated, destroys rheumatism and neuralgia, and that of the *cerceris*, in England popularly known as sand-wasps, produces insensibility,—local anesthesia. He also found that the poisonous matter of various fishes, including the weaver fish, which is common to the coasts of England and France, cures paralysis; and from these facts he supposes that the poison contained in the *Thalassophryne*, a new species discovered in San Francisco Bay, a couple of years ago, will also cure various diseases.

ART.—Marshall, so well known by his line-engraved portraits of Washington and Lincoln, has nearly completed a similar plate of Gen. Grant, on which he has been engaged throughout the summer. The engraving is after a life-size portrait painted by Mr. Marshall himself—a strong likeness, painted in a mellow color and in a broad style.

New Boiler Works.

We took a look into the boiler shop of Messrs. Baurhyte, McAfee & Spiers, on Howard street, a few days since, where we noticed two large boilers in process of construction for the Pacific Rolling Mill Company. These boilers are each 24 feet long by 48 inches diameter, with two internal flues of 16 inches diameter each. They will also be supplied with two mud-drums of same diameter and 16 feet long. These boilers are designed to utilize the heated air and unconsumed gases passing from the iron furnaces, which will be employed at the works, thereby affecting an important saving of fuel. At some of the iron establishments in Europe, boilers are heated exclusively by this usually wasted heat and fuel.

In addition to the above, we also observed two fire-box boilers, which are being made for the California Steam Navigation Company, and intended for a boat in the up-river trade. This boiler is eighteen feet long, over all, with five feet diameter of shell. It will contain about 200 tubes, two inches diameter.

The same firm are also building another fire-box boiler for the Messrs. Barron Bros. of this city, which is seventeen feet long over all, shell forty-four inches diameter. This boiler is intended for a boat now being built at Cozzen's shipyard, North Beach, which will be employed in and about the Bay. The boat will be stern-wheel, the engines for which are being built by Messrs. Keep, Blake & Co., of Stockton.

All of the above-mentioned boilers are being constructed of the best CH. No. 1 Am. flange iron. We are pleased to note these evidences of prosperity in this new firm. Mr. Spiers, who has lately connected himself with this firm, is a man of large experience and a most thorough machinist. All the members of the firm are working men, and fully understand their business.

There is no class of mechanics in the world who should be more thorough and conscientious in their work than boiler-makers; for on the work of none depends, to such an extent, the lives and safety of great numbers of human beings. A faulty plate of iron, placed, for the sake of a little gain, in a steamboat boiler, may cause the loss of hundreds of lives; or the unskillful or imperfect riveting, or other workmanship about the same, may send scores to an untimely grave. We have faith to believe that in no part of the world are these responsibilities more fully realized, and nowhere is more pains taken in avoiding all possible contingencies, than among the boiler-makers of this city. It may be instanced as a somewhat significant fact, that since the destruction and wearing out of the boilers, used in early times in this State, all of which were brought hither from abroad, there has been a most notable falling off in steamboat disasters. May we not justly attribute this most welcome fact to more skillful and conscientious work, for which the public are indebted to our own home artisans?

POULTRY FOR HOGS.—Nearly two tons of turkeys were hauled out to one of the hog ranches on the Potrero, a few days since, to be fed to swine—the market men preferring to make such a disposition of them, rather than sell them at lower than the regular market rates, which they could have done a day or two earlier. How much better it would have been to have delivered, at least a moiety of them, to the orphan asylums and other charitable institutions in the city, before it became necessary to make them food for swine, and after it became evident that buyers would not take them off their hands at the ruling rates.

HAWAIIAN RECIPROCITY.—Our neighbors of the Sandwich Islands are seeking to establish a reciprocity treaty with Japan as well as with the United States. If the treaty is concluded, it is expected that it will be transcribed to the Hawaiian Government by commissioners who will repair thither in a Japanese man-of-war. In such a case, we presume that the vessel will visit this port also, to impress the outside barbarians of California, with the formidable nature of the floating thunderer of the Great Tycoon.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

71,301.—**GANG-PLOW.**—James Harris, Santa Clara County, Cal.:

I claim, 1. The rocking bar E, to which the plows are attached, and by which they are turned over upon the frame.

2. The elevating lever F, the adjustable seat I, the gauge-screw J, the adjusting-screws K K, the lever-rest M, in combination with the rocking-bar E, as described, and substantially as set forth.

71,335.—**WATER-WHEELS.**—H. W. Shipley, Portland, Oregon:

I claim, 1. The combination of the parts D E E', when constructed and arranged in relation to each other as shown and described.

2. In combination with the foregoing, the arms or buckets B, constructed and arranged as described.

3. The gates H, hinged at the outer extremities of the guides F, and adapted to close inwardly, and provided with arms i i, in combination with the links f and ring G, when constructed and arranged in the manner and for the purpose specified.

4. In combination with the inwardly-closing gates H, and guides F F, the water-passages between the latter, when constructed so as to diminish in height from their outer to their inner ends, substantially as and for the purpose specified.

71,693.—**ANIMAL-TRAP.**—Geo. W. Brown, of Sacramento, Cal.:

I claim the arrangement of the tipping-plats as described and for the purpose set forth.

71,718.—**CAR-COUPLING.**—Mordecai Disney, of San Francisco, Cal.:

I claim, 1. A car-coupling, having a movable retaining-lip C, clutch b, and the detaching-lever E, the whole constructed and operating substantially as and for the purpose herein described.

2. The automatic catch d, constructed and operating substantially as and for the purpose described.

The object of this invention is to provide an improved self-coupling attachment for railroad-cars, by the use of which the danger of going between the cars is avoided. The cars may be easily disconnected at any time by means of a lever, while in case of an accident, as when some cars are thrown from the track, they may be instantly disconnected from those remaining in place. This device may also be used where only a part of the cars are fitted with it, as the ordinary link is used, and they will connect with the common couplings equally as well as with each other.

The coupling is constructed by attaching to the car a hollow bar, with an expanded mouth at one end to receive and direct a link. The upper side of the bar is a movable plate or lip, kept down by a spring from behind. A tongue of steel projects upward, from the lower lip of the bar, to a sufficient height, to hold the link, the upper lip rising to admit it, and immediately closing after it passes the tongue against which it rests. A lever is very simply arranged, by which, at any time, the cars may be easily disconnected.

71,747.—**GRADING AND EXCAVATING-MACHINE.**—T. C. Hammond, Nicolaus, Cal.:

I claim, 1. The construction of a plow with an angular upright standard, having a sole-plate or wing, and a mold-board and share, together with all the connecting parts, substantially as described for the purpose specified.

2. A double plow of the above description, all of the different parts of which are reversed and pointing and facing in opposite directions, and connected by a continuous beam and furrow-bar.

71,749.—**FIELD-DERRICK.**—Isaac J. Hattabough, Santa Clara County, Cal.:

I claim, 1. The double sheaves for the operating-line.

2. The pivots and plates at top and bottom of the pole, for the guys and pole-swivel.

3. The combination of the sheaves H, with the pivots to plates I I, in combination with operating-rope E, pole A, arm B, adjuster D, guys J, to make a simple and complete combination for a derrick for field purposes, as described, and substantially as set forth.

71,827.—**PLOW-WHEEL.**—J. B. Webster and Robert Baxter, Stockton, Cal.:

We claim the hoard or plates a, fig. 1, in combination with wheel, as and for the purpose hereinbefore described.

RE-ISSUES.

2,809.—**HARVESTING-MACHINE.**—David J. Marvin, Stockton, Cal.:

I claim, 1. In a combined header and thrasher, so pivoting or hinging the enter-frame upon the main axle a that it can be moved longitudinally, and also raised or lowered at pleasure, substantially as and for the purpose specified.

2. In a combined header and thrasher, having its cutter-frame mounted or hinged as above described, the combination and arrangement of the bar a', posts b' b', pulley d', cord c', and crank-rod N, substantially as and for the purpose herein set forth.

3. The arrangement of the sickle-plate h, aprons 2 and 3, corrugated feed-roller B, threshing-cylinder P, fan S, inclines o p, straw-carrier D, screen E, conveyor F, and elevator G, substantially as described.

4. In a combined heading and threshing-machine, as above described, the arrangement of the lever A, swinging axle a, and gear-wheels b' Q, for the purpose of throwing the threshing and cleaning-mechanism into or out of gear, substantially in the manner specified.

QUERY.—"N." asserts that two steam engines, having their cylinder constantly supplied with steam at fifty pounds pressure per inch, are to each other, in effective capacity, approximately as the areas of their pistons, multiplied by the stroke; hence, that a steam engine having a cylinder of double the length of a second one, of equal diameter, will have approximately double the effective capacity.

"W." asserts that they are to each other, in effective capacity, approximately as the areas of their pistons only, that the horse power of each is the same. Who is right? Please answer and oblige

TWO READERS.

"N." is right, provided the engine having a cylinder of double the length of a second one, of equal diameter, makes the same number of strokes per minute, in which case the piston will travel at twice the velocity, and consume twice the amount of steam; and *wrong*, provided the pistons of each engine travel the same number of feet per minute, in which case they will give the same power.

"W." is correct on the basis of the pistons traveling an equal number of feet per minute, and also correct according to common usage.

NOTE.—The power of a steam engine is determined by the area of the cylinder, the average pressure of steam throughout the stroke, and the velocity of the piston, in feet, per minute, and variable in the direct proportion of either of these; thus:

1st. The area of the cylinder and pressure of the steam being the same, the power will be as the velocity of the piston in feet per minute.

2d. The pressure of the steam and velocity of the piston being the same, the power will be as the area of the cylinder.

3d. The area of the cylinder and velocity of the piston being the same, the power will be as the pressure of the steam.

In calculating the power of a steam engine, the length of the stroke is only regarded as a means of ascertaining the velocity of the piston in feet per minute.

CONFUSED.

A morning cotemporary considers it "a source of confusion" that the fire-alarm bells are made to strike, not in exact unison, but following one another at short intervals of time, "with just enough difference to utterly confuse a person endeavoring to count the strokes." Our neighbor makes the "difference" about half a second; at our place of residence, the difference is several full seconds, but we never thought of complaining of the annoyance, for the simple reason that it is one of those things which can't be helped. The trouble does not originate from a difference in time of striking upon the different bells, but from the fact that the various points of observation are located at unequal distances from the several bells, so that the sound of the simultaneous striking reaches those points at unequal periods of time. It is a very simple problem in natural philosophy.

A "COLLEGE OF ARTS as applied to Industry," is to be established in Paris.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, - - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the *theory*, the latter the *practice* of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Sutt.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Felton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important subjects—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the simplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Demmon.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them details of the education of young men in America to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Alwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Hervon Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*I. H. Bryant.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Boirie.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, nearly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as you go on, gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marquette Appeal.*

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Travelling Agents.

Issued by the United States or Foreign Countries, procured
in the shortest time possible.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Amador County.

Ledger, Dec. 28th: Last Monday was "clean-up day" at the Oneida mill, and a very handsome yield was the result. The amalgam was melted by Mr. Riching, of this place, and run into "bricks," worth a little over \$10,000 each. We did not ascertain how many tons of rock were crushed, but it was the proceeds of a run of 20 days with 40 stamps.

A company of miners have purchased Hartrum's garden, adjoining Volcano, for the purpose of mining it out. The price paid for the ground was \$6,000, in gold coin. They are now sluicing off the top dirt, and by spring it will be ready for taking out the gold. This is one of the richest pieces of mining ground in the State.

The Pioneer mine has been purchased by L. McLaine and Sorocco Brothers, and active operations will at once be commenced on it. They have made arrangements with Mr. Thoss, and he will work the rock in his mill by a process, known to himself, that never fails to extract all the precious metals contained in the rock.

Butte County.

Oroville Record, Dec. 28th: J. J. Buckius, at Brock's hardware store, and tin and sheet-iron manufactory, has just completed five hundred feet of thirteen inch pipe, for the use of the Oroville Mining Company's claim. From the superb manner in which Mr. Hewett is fixing up his claim for working, we infer that he has struck it rich in the bluff.

Calaveras County.

Chronicle, Dec. 28th: The recent violent storm has been the means of suspending all operations in quartz in this vicinity. Nothing can be done until the weather clears up and a bottom can be found to the roads.

San Andreas Register, Dec. 28th: William Irvine is getting into position a large lot of very heavy iron pipe, for the purpose of throwing sufficient water on his mining wheel, in order to keep his stamps in continual operation while he is pumping the water from his claim.

Inyo County.

Virginia Enterprise, Dec. 28th: We have been shown private letters from Cerro Gordo district which speak of the mines of that region as the richest ever seen east of the Sierras. The leads appear to widen as they are followed down, and veins but two feet wide at the surface expand to a width of eight feet at the depth of 60 feet. All the ore of the district must be smelted, and furnaces, instead of mills, are used for its reduction.

Mariposa County.

Mail, Dec. 24th: From Coulterville we have the following items: McKeo & Flanagan's new steam quartz mill started on Monday, December 9th. Everything works well, and the mill is crushing good ore. H. G. Coward's new quartz mill, on the North Fork of the Merced, commenced crushing. This mill is run by water power, two batteries of five stamps each. We understand that Mr. Coward is taking out good rock from the Marble Springs vein.

Nevada County.

Transcript, Dec. 25th: In consequence of the damage to ditches and flumes by the storm, mining operations are almost entirely suspended in the lower part of Bridgeport township. The heavy flume and iron pipe which carries water to the Buckeye Hill was blown down on Sunday, and on Monday all the ditches were empty in consequence of breaks above. In the San Joaquin Co's claims a heavy cave occurred, burying hose, pipes, etc.

Dec. 27th: Star's flumes at Little York were damaged to the extent of \$300 by the late storm.

Dec. 28th: Thirty boxes or about 400 feet of the flume in the bed of Greenhorn Creek, were carried away by the late storm. This is one section of the work which was not completed. The balance of the work is said to have stood the flood well.

In the vicinity of Moore's Flat, several extensive mining enterprises are being prosecuted with a fair show of success. The Kentucky Mining Co. have temporarily suspended work in consequence of the large quantity of water in their claims, and will resume operations in the spring. This Co. is sinking an incline for the purpose of striking the great gravel channel which Professor Whitney says enters the county at Snow Point. A mining company at Mount Zion, which has been running a tunnel for eight or nine years, struck upon excellent pay gravel a short time since, and the tun-

nel is now being pushed for the body of the channel. A project is on foot for sinking an incline through a heavy slide at Moore's for the purpose of opening the channel beneath it. The old mines about the Flat are yielding good returns, and when the new one is opened the gold yield will be considerably increased.

Dec. 29th: A considerable damage was done by the floods to the mining claims at Rocky Bar, near Washington.

The flume in Johnson's old claims, now owned by Kellum & Co., of San Francisco, were destroyed, and the cut closed up by a slide which occurred at Gopher's Point during the late storm. All the mining claims in the vicinity are shut off from their supply of water, with the exception of the Enterprise. The miners are talking of turning in a heavy head of water, and running off the dirt, so as to enable them to resume work.

Gazette, Dec. 25th: All the flumes connected with the mining claims at Red Dog were blown down on Monday night. All mining is suspended for the present.

Dec. 27th: The storm moved things around in this part of the country quite lively. The hoisting and pumping machinery, at the Leecompton mine, was carried off, together with considerable quartz, involving a loss of \$5,000 or \$6,000. The flume of the Nevada Company's quartz mill was damaged to the amount of \$200 or \$300. A large rock, weighing 75 or 100 tons, lying at the Nevada Co's dam, was rolled over by the force of the current. The sluices, derrick, and other fixtures in Leathe's diggings, at Stocking Flat, were swept off. His loss will amount to \$400 or \$500.

Mr. Whartley received a letter yesterday from the agent of the ditch company at Dutch Flat, who says several hundred feet of fluming on the Dutch Flat branch has been blown down, and the ditch otherwise damaged so that some weeks will be required to repair it.

Dec. 30th: The claims of Ashburn & Co., at Scotch Flat, were damaged to the amount of \$600 or \$700 during the late storms. Portions of their flume and pipes were carried away by the high water, while other portions were buried by the caving of the banks. The Bean Co's claims were damaged to the amount of about \$200. The claims on the opposite side of the creek were not damaged by the high water, but were rather benefited by the clearing out of the tailings and giving them a better fall.

Dec. 31st: Work on the Chalk Mountain Co's claims at the Cascades was not interrupted during the late storm, and their prospects continue to improve. Sately, the Secretary of the Co., offered a pair of gum boots to the first man who found a \$50 lump. A few days later, one of the workmen picked up a nugget weighing \$52. This was sent below, and the gum boots came up in due time. They frequently get prospects of \$10 and \$12 to the pan. Work is also progressing in the claims of Reidy & Co., but they have still considerable to do before their claims will be fairly opened.

Grass Valley National, Dec. 28th: The placer diggings in Mohawk Valley are doing well, some eight or ten companies are wintering in the valley—and three embryo towns are already located—Hardscrabble, Licksillet, and Stringtown. One of the companies wishing to raise a stake for Christmas, set their sluices, and after three or four hours cleaned up \$225, one piece weighing over one and a half ounces.

Dec. 30th: The Grass Valley Foundry has just completed the casting of a cylinder for the Eureka Co. The cylinder is 16 inches in diameter.

Placer County.

Herald, Dec. 28th: We saw three little specimens from the Perry & McGonigle claim this week "no bigger than a man's hand," that weighed a little over four pounds, 95 per cent of which was pure gold. This sort of ore is known to exist for a distance of 25 feet, and may continue for thousands. We have heard that buckets of this ore are sometimes quarried out that is too heavy for a stout miner to lift from the bottom of the shaft.

Anburn Stars and Stripes, Dec. 26th: We have just examined several large gold specimens, weighing from one-half to a pound each, which were taken from the Black Ledge. In a shift of eight hours, it is estimated that from \$10,000 to \$12,000 was obtained. The work is still going on without any apparent sign of giving out. This gold was found at the depth of 54 feet from the surface. This ledge is a decomposed mass of black quartz or rock, having gold all through it, much of which appears to have been melted and run into large masses of gold. It is situated in a field of quartz ledges more extensive than any other in the State, and most of the ledges are known to contain sufficient gold to justify the em-

ployment of capital to work them, with a certainty of ample returns.

Plumas County.

The Sawpit Flat correspondent of the *Downieville Messenger*, of Dec. 21st, gives the following items: The recent storm has given us an abundance of water, and the ditches are all full. Some of the companies are cleaning up pay dirt. The New York Co. have just finished. I am informed that they cleaned up 537 ounces, which amount will pay all losses sustained by the late fires, also the laborers for taking it out.

The Folland boys, of Richmond Hill, are doing well in their piping claims, piping day and night. These are all the claims washing up at present. Some parties who own piping claims in this place, have gone below for the winter, so that little more washing will be done here this winter for that reason.

The Eagle Co. have had some good prospects during the last week.

Sierra County.

Downieville Messenger, Dec. 21st: All of the hydraulic diggings in the northern part of the county have been running a full force of hands during the fair weather. The Docile mill was started on its regular work on the 12th inst. It runs very smoothly and crushes fast. It contains 10 stamps of 600 pounds each, and is driven by a Hurdly-gurdy water-wheel under 200 feet pressure of water.

The miners of Rattlesnake have made the most of the recent good weather, and have got a splendid start for the spring's work.

The Downieville correspondent of the *Marysville Appeal*, of Dec. 28th, says: The season has been very favorable for the miners, and until within two or three weeks all the river claims have been worked; at Eureka and Morristown, and in other hydraulic diggings, the miners have been busy at work with plenty of water.

During October and November considerable prospecting was done. On the Wehe and Tuhai Cain, good prospects were found, but work for the season was suspended. The Docile Co. and the Phoenix have very rich ledges, and both have new mills up. The Docile is hard at work pounding up rich rock. One of the most valuable ledges we have is owned by the Good Hope Co., but owing to the lack of means, the company have not as yet built a mill, although the ledge, as far as prospected, will warrant the outlay. It is now in the hands of a San Francisco party for sale for \$50,000.

The Brush Creek ledge, near the Mountain House, is without doubt the richest ledge in California. The company intend putting up a 30-stamp mill in the spring.

Yuba County.

Marysville Appeal, Dec. 22d: Messrs. Kendall & Boyle exhibited to us yesterday samples of golden cement from their rich mine at Bangor.

We learn that the mines at Brown's Valley have not been interrupted by the late storms, and that all of the mills are crushing rock and making money. The Jefferson has been running part of the time lately on rock from the Rattlesnake mine.

COLORADO.

Denver News, Dec. 11th: The war at Boulder concerning the jumping of the Hoosier silver lode has been ended by the arrest of the jumpers. The lode is now in the possession of the legal owners.

At the Colorado National Bank, this morning, was a bar of gold bullion weighing 36 29-100 ounces, fineness \$38, value in coin, \$635.10.

C. A. Scott writes from the Cimmaron diggings that they find from five to 25 cents to the pan. He has secured claims in Dry Nigger and Humbug gulches.

Central City Register, Dec. 10th: The Discovery shaft on the Herkimer lode is now down 65 feet, and shows two veins of rich ore, one three and the other seven inches thick. Ten or twelve rods east the vein has been stripped for some distance, showing from 8 to 13 inches of the rich, argentiferous galena and silver sulphurets. An average of ten inches assayed by Prof. Martine, went \$700 per ton. Six or eight rods east of this open cut again, an adit has been faced down. At this point the walls of the lode are seven feet apart, there are three and a half feet of quartz, carrying five narrow, but rich seams of mineral.

Prof. Hill's matting furnace began work on Monday week, smelted about 50 tons of ore, and stopped on account of the failure of the fire-brick or tile in the terrace furnace, used for calcining tailings. New brick will be substituted. Contracts have been let for the construction of a reverberatory furnace, to be finished in four weeks.

The shipments by Wells, Fargo & Co's Express for the week ending Dec. 3, amounted to \$18,650.

Georgetown Miner, Dec. 5th: A small

lot of galena ore, from the Malahar lode, was recently run at the Georgetown Smelting Co's works, which yielded \$85 in silver to the ton of ore. The ore carried 78 per cent. of metallic lead to the ton.

We have seen a fine piece of silver bullion weighing 15 ounces 10 dwt., extracted from 20 pounds of ore from the Henrietta lode, East Argentine, by Messrs. Stowell and Litchfield. This shows a yield of \$209.25 in silver, coin value to the ton of ore, currency value \$272.80. The ore is from eight to 24 inches in width, a very fine sulphuret of the same character as the Belmont.

Kinney has started up his stamps and furnace on Young America ore. He made a test a few days since of 25 pounds of ore, from which he obtained seven ounces of hard amalgam.

The *Times* says that Robert Teats has just finished a run of Smith & Parmelee ore with most satisfactory results. The average yield was five ounces to the ton; value \$18, coin, or between \$80 and \$90 a ton. Two additional cylinders are to be put up immediately at the California Reduction Works.

IDAHO.

Owyhee Avalanche, Dec. 14th: We have been shown some ore taken from a ledge recently discovered up the gulch not far from the Whisky mine. The ledge is from 10 to 15 inches wide near the surface, and if the mass of the ore is half as rich in gold and silver as that shown us, the discoverers will be sure of a fortune. It is called the "New Whisky."

Col. Fogus has struck another rich ledge on the mountain above Silver 'ord. The Colonel had observed rich float quartz in that vicinity for some time, and going up the mountain side as high as any float could be seen, he sunk down and struck rich gold bearing quartz, which he is of the opinion is the source whence the previously discovered pieces came.

A rich clean up has recently been made from Ida Elmore rock, worked at the Lincoln mill. The yield was handsome, but we are not at liberty to state the amount. Work will be continued upon the mine during the winter.

Five tons of ore from the Whisky mine were this week worked at the Cosmos mill, yielding \$140 per ton.

The Boise *Democrat* says that an excitement has been created in Boise City by the discovery of two gold and silver bearing quartz ledges. They are situated in the vicinity of Willow Creek, and are named the "Golden Age" and "Surprise." The former is over 40 feet wide, and fine gold can be seen in several pieces that were brought into town. There are some parties at work mining in the creek between the ledges. It pays \$8 per day.

Owyhee Avalanche, Dec. 21st: Wm. Lent, Geo. Hearst and others, of San Francisco, have purchased the Rising Star mine in Flint. They have also purchased Gen. McQueen's lease, so that they now own the entire mine, for which they paid \$30 per foot. The purchasers have incorporated under the title of the "Rising Star Co." It is the intention of the company to erect a large mill as soon as possible.

The late snow has improved the roads, and immense quantities of quartz are being hauled to the mills. At almost any time of the day, and often in the night, numerous horse, mule and ox teams pass through our streets heavily laden with the precious ore. For instance, 40 tons per day are now taken to the Owyhee Co's mill.

MONTANA.

Post Dec. 14th: In Norwegian Gulch, there are found extensive deposits of gravel from 18 to 23 feet deep, while on the bars, the bedrock is seldom over eight feet in depth. The miners on these claims have made considerable money. The claims are easily worked, and the gold is of unusual fineness and is generally coarse, and what is termed wire gold.

It is rumored that Col. Allen has sold the Allen lead, located in Ten Mile District, to a St. Louis company for \$160,000.

Rich diggings are reported to have been struck on the Big Boulder, some five or six miles above the crossing of Virginia City road, and quite a furor exists in the valley about them.

The 10-stamp mill of the Lost Lake Co. in New York Gulch, recently cleaned up \$1,100 from 70 tons of ore from the Little Giant Lode. The tailings of the mill have been saved, and it is thought they will yield largely.

Ricker informs us that Hendrie's mill cleaned up 187 ounces of handsome retort from the last run of Whitlatch Union ore for the I. X. L. Co.

Messrs. Parrott & Co's patent four stamp quartz mill is a complete success. The other day it crushed a ton of ore in one hour and a half. The machinery works

easily, and the rock is pounded as finely as in any of the other mills. It is now crushing ore from the Discovery claim on the McIntire lode, and on Wednesday last the plates were looking finely.

The St. Louis and Montana Co's mill at Flint Creek is running constantly and turning out hullion at a rate perfectly agreeable to those interested. The mines are improving as developments bring their riches in view, "the Hope, Comanche and Poor-man leads far exceeding expectations." Messrs. Taylor, Madison & Co., have purchased 1,100 feet on the Van Dieman lode, northeast of the Comanche, and are developing it. The vein of the pay ore is 13 feet wide. One of the Company is about to start East, and will have a mill gotten up in St. Louis this winter from California patterns of the latest and improved character. Everything is lively at Phillipsburgh.

The Argenta correspondent writes that precisely seven weeks from the day the first blow was struck on the Elser Smelting Works, the first charge was put in the furnace. The furnace works to a charm. During the first 24 hours, one ton of rich lead was run out. There is now out 6,000 lbs., 2,600 lbs. per day, worth from \$500 to \$550 per ton. When from 12 to 15 tons have been run, the furnace will be stopped and the cupel started, it not being deemed advisable to crowd the works at first. When working to its full capacity, two tons of lead per day will be run, and from 20 to 25 tons expelled at one operation.

NEVADA.

Humboldt.

The Unionville correspondent of the Marysville Appeal, of Dec. 20th, writes: "From all parts of the country we have favorable accounts. Mr. Fall has been quietly working his mine for the last six or eight weeks with a force of 20 men, keeping the Pioneer mill running day and night. The public was startled a few days ago upon learning the fact that he has all along been taking out ore by the tons of the value of \$1,000 per ton, and that too, from the finest vein ever discovered in this county. This mine is five ft. wide at a depth of 70 ft., encased between two as fine walls as I ever saw, piteb into the mountain at an angle of 45°. This entire vein from wall to wall is rich pay. This mine is located in a rich belt of ore which can be traced by float rock for a distance of two miles or more. The belt will now be thoroughly developed. The Seymour Co. have struck a small vein of ore of the same character as the Aragona, about a mile south. The vein is very thin on top but increases as they go down. A New York company has secured the National mine, and in a short time will proceed to its development. It will erect a mill early in the spring. Mr. Fall is now making arrangements for a 16-stamp steam mill for his new mine. With his new mill and the Pioneer, he will be able to reduce from 25 to 30 tons per day. The supply of ore is amply sufficient to keep both mills running day and night."

Unionville Register, Dec. 21st: The quartz mill belonging to the Monroe Co., is now being laid down in Dun Glen, where it will soon be put up and in running order.

The Essex Co's mill, at Dun Glen, is expected to be ready early in January. Work is being pushed vigorously on the mines, and large quantities of ore are now being piled up in anticipation of the early completion of this mill.

Gov. Fall is making arrangements to resume work on this mine at an early day. The ore will be worked at the Essex mill, in Dun Glen.

Fall & Co. shipped this week by Wells, Fargo & Co., 1,700 ozs. of hullion.

Pahrnagat.

Reese River Reveille, Dec. 18th: Mr. W. Fleming, Supt. of the Alameda Co., arrived from Pahrnagat last evening, and reports the arrival of the machinery for Ostrom's mill at Hiko. Mr. Fleming speaks highly of the fine appearance of the company's claim on the List ledge, which is the most fully developed and promising in the district. Several companies are prosecuting work under encouraging circumstances.

Reese River.

Reveille, Dec. 18th: This afternoon a team arrived in the city with 9,700 lbs. of ore from Leon & Co's claim upon the El Dorado ledge in the Silver Bend district. We saw a few of the sacks opened, and the ore appeared to be of a high quality. There was one chunk of 260 lbs., which looked as though it would yield half that number of dollars. The ore was brought here for reduction at the California mill, and is at present at Triplett's stable.

There arrived in this city last night 3,070 ozs. of erude hullion from the Old Dominion mill at Hot Creek.

Dec. 20th: Two bars of bullion from the

mill of the Belmont Co. arrived in the city last night; also 1,500 ozs. of erude bullion from the Old Dominion mill at Hot Creek.

Dec. 23d: A lot of upwards of 100 tons of ore from the Great Eastern mine, sent to the California mill for reduction, in all 11½ tons of very rich ore, the pulp assay of which was \$408 per ton. The small lot was carefully selected. The great proportion of the ore was second class, which will yield about \$125 per ton.

Silver Bend Reporter Dec. 21st: The ore in the incline of the El Dorado South still continues of about the same quality, as a week ago—assays ranging from \$400 to about \$5,000 per ton. A depth of 16 feet has now been sunk in this body of rich ore. The incline will be continued until water is reached, when the levels will be run and preparations made for mining upon an extensive plan and in a thoroughly systematic manner. In the absence of a custom mill, the ore taken from the vein will be sent to Austin for reduction. It is estimated that the ore already out will net a sum sufficient to reimburse the owners for all expenditures made upon the mine to the present time. A shipment of 5½ tons of ore will be made to-day, aggregating upwards of 13 tons forwarded since the strike.

On the 12th inst. there was received at Austin hullion valued at \$3,000, from the Kuickerbocker mill, Ione district.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, Dec. 20th: The Mariposa mill, at the foot of Cedar Hill, having become the property of the California Bank, has been remodeled and renamed. It is now called the California mill, and is rigged up in the same style as the mills at Grass Valley. There are no pans and no arrangements for saving silver. It will run upon gold rock from the Sacramento mine, on Cedar Hill, Steel & Co., (who have a contract for taking from the mine some 200,000 tons of ore) furnishing the mill with the rock.

Dec. 21st: Well, Fargo & Co. shipped from this city and Gold Hill, during the week, 4,317 pounds of assayed bullion, valued at \$104,135.94.

Dec. 22d: A small lot of ore from the Independence lead, Washington district, worked at the Eclipse mill, Gold Hill, according to assay by Van Wiek & Co. yielded as follows: Gold, \$19.22; silver, \$14.21—total, \$33.43 per ton of ore. Value per ton of bullion, \$3.20.

Dec. 24th: Owing to an accident to the hoiler of the Chollar Potosi hoisting works, work on the mine has been discontinued, until the necessary repairs are made.

Dec. 25th: Last night's freshet was exceedingly disastrous to the Bowers' mill. An immense body of water came down, carrying with it hundreds of tons of rock. The ditch soon filled up notwithstanding the utmost exertions of 15 or 20 men. As soon as the water broke over the embankment, an acre of ground back of the mill was covered with the debris from two to four feet deep, and the mill even to a greater depth. The well in the mill, and the tanks, and many of the pans were filled. About 40 tons of pay ore was swept down with the general mass. The damage done will probably amount to \$5,000; besides it will take four weeks to get the mill ready.

Dec. 29th: From every quarter we hear news of the destruction of property by the late flood, on both Six-mile and Gold Cañons, the sluices for saving sulphurets and the reservoirs of tailings have been swept away and the roads so washed and gutted as to be impassable. The mills have not suffered much damage, except to outside property, as to dams, wood, the breaking of ditches, washing away of tailings, etc. About 50,000 tons of tailings were swept out of the big reservoir, in Six-mile Cañon, of Janin, Bonner & Parks. The tailings were estimated to be worth \$12 per ton.

Enterprise, Dec. 28th: Owing to the terrible condition of the roads over the mountains, no hullion has been shipped during the past week. Several tons are lying at Wells, Fargo & Co's that will be shipped as soon as the roads improve sufficiently.

The majority of the mills in Gold Cañon stopped by the late flood have resumed work.

OREGON.

The Oregonian of the 18th, says: Mr. C. H. Seeley, Supt. of the La Grando Gold and Silver Mining Co., showed us last evening a specimen of rock taken from the Gem of the Mountain ledge, Eagle Creek. It was taken from the bottom of the inclined shaft, at a depth of 250 ft. It shows very rich evidences. The company have been working the mine during the past summer, with a 5-stamp mill of imperfect make, and

have realized an average of \$18 to \$25 per ton. The Humboldt Co. with a better mill, have been saving \$30 per ton from rock from the same ledge. Mr. Seeley is here for the purpose of procuring better machinery, and has contracted with the Willamette Iron Works for a 10-stamp battery and a 30-horse power engine, which he designs to send in to the mine as soon as completed. The La Grando Co's mine is well developed, and they have, apparently, a fine prospect of realizing from it. The shaft is sunk about 300 ft. on the incline, and at that depth, the ledge is eight ft. wide. For the last few weeks, three men in the shaft have got out on an average of eight to ten tons of rock per day, and Mr. Seeley thinks that 10 or 12 men in the mine and mill can run a 10-stamp mill to its full capacity.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA.

San Francisco, May 24, 1866.

Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way merit our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAUST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITREID & LEAVITT,

Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SMITH,

Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

1st.—Because it is impossible for either burglar or expert to pick it.

2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SHIFMAN, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SHIFMAN, County Clerk.

CALIFORNIA LOCK ARCADE.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the PRESS several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily made known to the masses. It is ultimately certain to attain Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—[Mining and Scientific Press, Sept. 29, 1866.]

They are the only SAFE lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which it was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

L. MC LAINE,

Any good blacksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 30 in Pacific Coast Directory.]

A dealer or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

Canvassing Agents.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. C. T. Kane, is our duly authorized agent for Sacramento County. Nov. 29, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

OUR NEW YORK AGENCY.—MR. M. A. LATHROP, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No. 726 Broadway, for the present. Nov. 26, 1867.

San Francisco:

Saturday Morning, Jan. 4, 1868.

Notices to Correspondents.

R. B. & Co., STOCKTON.—You evidently mistake the principle involved in the artificial manufacture of ice. The vacuum is not produced in the vessel containing the water to be frozen. The water to be frozen is placed in a vessel whose walls are brought in close contact with the walls of another vessel, which consist of two compartments, separated by a stop-cock. The fluid used is of a highly volatile character, such as ether, ammonia, etc. The water is frozen, not by the production of a vacuum, as by the pumping of air from a vessel partly filled with water; but by the rapid evaporation of the volatile fluid employed, in which the vessel containing the water to be frozen is placed, but necessarily separated from actual contact with the fluid by a double wall. The process of evaporation is hastened by the application of heat.

H. S.—In reference to your queries and communication with regard to the propriety of offering a State reward of \$20,000 for some cheap process for working rebellious ores, we do not think there is so much need for a new process, as there is for a better understanding among miners and millmen of the proper application of means and processes already known. Perhaps the greatest difficulty arises from the ignorance with regard to the application of the various known modifications which should be made to suit the different ores and different circumstances under which our mines and miners are placed, involving the peculiarities of the ores, the climatology of the locality of the mine, the facilities for wood, water, etc. A mining education, and the ability and inclination for a faithful and honest use of known appliances, is of more importance in California and Nevada, at this time, than new inventions and new processes.

I. D. F., B. S., AND OTHERS, Pioneer City, Idaho Territory.—In our last week's notice to these correspondents, a typographical error occurred; the yield in place of \$13.33, as then inserted, ought to have been \$1,333 per ton, the assay being \$2,243. The width of ledge said to be fourteen feet; its title "The Duncan Extension."

GALEN.—By "Vital Force" is that peculiar power by which the most important alterations in living, organized bodies are produced. All changes produced by mechanical attraction belong to the province of physics. Phenomena resulting from vital force, to that of animal and vegetable physiology.

ANTIQUARY.—Among the nations of antiquity the Egyptians appear to have possessed the greatest amount of chemical knowledge. They prepared sal-ammoniac, soda, common salt, vitriol, glass, enamel, tiles, painted earthenware, several metals and metallic alloys, soap, beer, vinegar, various medicines, pigments and cosmetics, and knew how to fix colors on silks by means of mordants, and to preserve dead bodies from decay.

PERSONAL.—Prof. Silliman, who has spent about a year on this, his second visit to the Pacific Coast, leaves on the steamer to-day for New York.

A National Mining School.

On the 2d of December, last, Senator Stewart introduced into the Senate a bill having for its object the establishment of a National Mining School, to be located at some central point in the mining region west of the Rocky Mountains. For the establishment and support of such a school, the bill provides that the present tax of one half of one per cent. on the bullion product of the country (about \$300,000 annually), shall be applied to the establishment and maintenance of such a school. It also provides that the school shall be under the control of a Board of Directors, to be appointed, one from each State and Territory west of the Rocky Mountains. The chief branches to be taught therein must be geology, mineralogy, metallurgy, chemistry, assaying, and mining engineering. Machinery will also be provided, and the details of operating it, and treating the various kinds of ores will be practically taught.

This bill has evidently been introduced in accordance with the suggestions of Commissioner Brown, as made in his last report now before Congress, but not yet published to the world. Letters from Washington, written at the time of the introduction of the bill, say that the project met with much favor at the Treasury Department, and will be warmly supported by most of the members of Congress. It will probably be the first matter on mines and mining which will be referred to the Senate and House Committees. The bill will no doubt find equal favor with the people at large.

The receipts, under the bill, for the first year, will be applied to the erection of suitable buildings, and the furnishing of the same with the necessary machinery, furnaces, and other appliances for the various metallurgical processes to be taught, all of which are to be built and furnished in the most economical manner consistent with the duty required. A commission, in the meantime, will be sent to examine the principal mining schools of Europe, and procure all available information, to the end that the Directors may be placed in possession of the most approved systems of instruction employed at such institutions.

The tuition in the school will be free to any citizen of the United States who may present proper evidence of qualification; it will also be open to the students from the schools of other countries, whose authorities shall duly recommend the applicants. All expenses for books, subsistence, traveling, etc., will be borne by the students.

The primary object of the school will be the increase of the bullion yield of the country by the practical application of science to mining, and the diffusion of a more general and correct knowledge among miners as to the best methods of opening and working mines and treating their ores. The Faculty of the school will be required to collect mining facts and statistics, and make annual reports of the same to the Treasury Department, to be thence communicated to Congress and to the country at large.

The necessity of a Mining School, conducted on a most extensive and liberal scale, has long been apparent to all intelligent and reflecting men acquainted with our mines and mining interests. The lack of any proper national, or universally acknowledged source of reliable information, has afforded opportunities for the introduction and growth of a class of imperfectly educated mining experts, who, by their constant succession of failures, and often downright impositions, have engendered a natural feeling of distrust toward all who claim any scientific knowledge of the theory of mining and metallurgy. Under this condition of things, it is not strange that mining, as a science, is almost unknown on this coast—every man pursuing his own course, ignorant of the why or wherefore, satisfied if he can only obtain a fair profit from the richest of our mines, careless of whatever

he may lose in his manipulations, and totally ignoring, as valueless, what probably constitutes the great mass of all the ores in the country, simply because he cannot work them to a profit by the wasteful and extravagant manner of working with which alone he is acquainted.

The fact is now almost universally acknowledged that we are losing from 30 to 50 per cent. of the actual value of all the ores treated on this coast, to say nothing of the immense losses which the country is sustaining by the rejection of low grade ores, rendered necessary by the imperfection of our mining education and practical appliances. If we estimate the present yield of bullion at \$70,000,000, a systematic and thorough system of working the ores now being manipulated might raise that yield to near \$100,000,000; while the bullion attainable from the now rejected ores might be made to reach half as much more. These estimates are based upon facts beyond cavil, and the improvements hinted at are attainable only by the establishment of some institution such as is contemplated in the bill under consideration. It cannot be expected that any important improvement can be arrived at in a year or two. It will require many years to raise up an educated corps of miners and mining engineers, capable of properly directing even the mining interests already developed. But a beginning must be made, and every day's delay is costing the country thousands of dollars. That the bill is all that can be desired is not probably claimed even by its originator. We trust that it will be passed at the earliest practical moment; and amended, if necessary, as circumstances shall seem to render expedient. In the meantime, the Commission may be appointed to visit the schools of Europe. No farther movement, other than originating a Board of Directors, should be made, until the return of the Commission, when the Board will be put in possession of facts, upon which they can act understandingly. With regard to the organization of the Board of Directors—better satisfaction and more exact justice would be given by apportioning them among the several States and Territories, on the basis of population, rather than as the bill proposes.

OUR LAST ILLUSTRATION.—Most of our readers, no doubt, noticed the omission, in our illustration of last week, of the letters referred to in the description of the same. The plate was received from New York, together with an impression, which we naturally inferred, was taken therefrom. That impression, however, must have been taken from another plate, as it was the same as that given in the Press, but fully lettered, and from it our description was written, instead of from a proof sheet of the plate taken in our own office. The wrong plate was evidently sent us, and the omission of the lettering was not discovered until the edition was nearly all printed. By a careful examination of the illustration, however, our readers will have no difficulty in fully understanding it. We shall not again trust to proof impressions from New York.

KUSTEL'S NEW WORK.—A treatise on the Concentration of all Kinds of Ores under the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, profusely illustrated with 120 diagrams, has just been issued from the press. We shall notice it, at length, next week. The price of the book is \$7.50 in coin, on the receipt of which it will be sent to any part of the United States, postage paid. Orders addressed to Dewey & Co., at this office, will be promptly attended to. See advertisement in another column.

NEW CONCENTRATOR.—One of Wheeler & Randall's new concentrators was recently put up at the Brunswick mill, on the Carson river, and used below all other machinery hitherto employed at that mill. We understand it is saving daily about ten pounds of quicksilver and two pounds of amalgam. This, we believe, was the first of these machines put up at any mill, it having been but recently invented. The success of this machine has been such that six others have already been ordered for six different mills in that vicinity.

Jeremiah Day, D.D., LL.D.

In the list of distinguished dead for 1867, published in our last issue, the name of President Day was inadvertently omitted. No name is more eminently worthy of an extended mention than that of this venerable patriarch. It is one which is conspicuous among those of two successive generations of notable men. Born in 1773, he was, at the time of his death, in August last, in the ninety-fifth year of his age. In 1789 he entered Yale College; in 1798 became one of its tutors; in 1801 was appointed Professor of Mathematics and Natural Philosophy, and in 1817 was made President. For twenty-nine years he filled that position, and in 1846 resigned. For the last twenty-one years he has resided in the family of his son-in-law, in New Haven,—to the last connected with the College as Trustee.

President Day was one of the first mathematicians of his time. His text books are well known. While occupying the Professor's chair, he published, in 1814, his "Algebra," and "Mensuration of Surfaces and Solids," in 1815 "Plane Trigonometry," and in 1817 his "Navigation and Surveying." All these books have passed through several editions.

Although, at the time when he retired from active duty, he was considerably past the three score and ten years, usually reckoned as man's allotted age, he did not suffer his mental powers to rust from disuse, but, by constant, moderate exercise, kept them bright and clear for the whole of the additional score which were granted him. The revival of his works, family and friendly correspondence, and the discussions of the "Ex-officio Club" which met weekly in his study, and was composed of retired clergymen and other professionals, occupied much of his time. He retained his physical vigor, too, in a remarkable degree. To the last, he took his daily walks to the postoffice, regardless of the weather. His hand-writing at the age of 93 showed, except to those most familiar with it, no signs of decrepitude. Until within a few months before his death, a slight deafness was his only apparent serious infirmity. On last Commencement Day, a few weeks previous to his death, he received a visit from the surviving members of the college class which graduated just half a century before,—the first under his administration as President. He gave them a cordial reception; and with them conversed freely of the years and the men that had passed away since the day on which those who remained,—now, themselves old men,—had received, through his fatherly hands, the farewell blessing of their Alma Mater.

President Day was twice married. His first wife was the daughter of Roger Sherman, the Connecticut Statesman. Of all the children who were the fruit of the two marriages, the sole survivor is the first-born, Hon. Sherman Day, of California, member of the State Senate in 1856.

PATENTS AND INVENTIONS FOR 1867.—During the year ending September 30, 1867, according to the Report of the Secretary of the Interior, there were 16,547 applications for patents; 11,655 patents (including reissues and designs) were issued; 1,224 applications were allowed, but have not issued thereon, by reason of the non-payment of the final fees; 3,486 caveats were filed; 96 applications for extension were received, and 82 extensions of patents were granted.

During the same period the receipts were \$611,910.61, and the expenditures \$553,599.98, leaving a balance of \$58,310.63, which added to \$228,297.26, the balance on hand September 30, 1866, makes the amount now in the Treasury to the credit of the Patent Fund, \$286,607.89.

In my last annual report, says the Secretary, I advised a repeal of the law conferring upon a party the right of appeal from the Commissioner of Patents to one of the Judges of the Supreme Court of this District. Subsequent reflection has confirmed my conviction of the soundness of the views then presented. In no other instance is an appellate power given to a Judge to affirm or reverse the action of an executive officer.

ENERGETIC MEN OR WOMEN CAN MAKE MONEY
In canvassing for our **NEW BOOKS** and **ENGRAVINGS**.
One Agent reports thirty-three orders for one Book in three
days. Address, **PACIFIC PUBLISHING COMPANY,**
415 1/2 Rth 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS. Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zeus Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Frater's concentrators, Wakley's pans, Beers' pan, German Barrels, Arastra Gearing, Gold Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Camis, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

ELECTROTYPING CUTS, ENGRAVINGS, Etc.—Our Job Printing
Office is abundantly supplied with elegant engravings, or
namons, and other embellishments to suit the various
branches of industry in this State.

OPIMUM EATING IN ENGLAND.—England, which once went to war for the purpose of drugging the Chinese with opium, is in a fair way of having the poisonous chalice commended to her own lips. We see it reliably stated that in the eastern counties of England, opium-eating is spreading to an alarming extent. In the town of Lynn, a single chemist sells 200 pounds of solid opium annually; another sells over half that amount, besides disposing every week of five or six gallons of laudanum and as much Godfrey's Elixir, a composition consisting of one-third opium. In other places the statistics are equally startling. Visitors to that part of England easily discern the effects of this pernicious habit in the miserable, feeble, brownish-yellow countenances so striking among many of the inhabitants, while the infant mortality of the district is excessive.

The new grass so rapidly growing in the South, called Lespidasa, came from Japan. The Charleston papers unite in pronouncing it the greatest blessing in the form of grass that has ever been bestowed on the South.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.

Hamburg, by Hamburg mail—2 cents each.

Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.

Lauenburg, by Bremen mail—3 cents each.

Lauenburg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.

Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—4 cents each.

Italy, by Bremen or Hamburg—5 cents each.

Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen and Hamburg mails via Trieste—4 cents each, and 2 cents per 1½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.

Hamburg, by Hamburg mail—1 cent per ounce.

Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.

Lauenburg, by Bremen mail—1½ cent per ounce.

Lauenburg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.

Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.

Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.

Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

CALIFORNIA ABROAD.—An Eastern Magazine, the New York *Exchange and Review*, discourses with regard to the present condition and future prospects of California as follows: "The statement from California that for nine months of the present year the value of the exportation of wheat and flour from San Francisco was \$9,347,000, shows that the agricultural interests of that State are extending. A few years ago wheat was carried to California to feed a population busy in the search for gold. Now, that region not only supplies all its own people, but has a surplus of cereals to send abroad. From these present advantages the future prospects of California may be prognosticated. Every year the cultivation of the ground increases. Fields and vineyards are planted upon virgin soil, and the crops of grapes, vines and grain are satisfactory to the people of the State. With the agriculture of the great Pacific State, her commerce must also increase. Already the new line to China and Japan is bringing to her the rich trade of the Indies—that prize for which the kingdoms of Europe struggled so long. The opening of the great Pacific railroad will insure to San Francisco the commerce of the world, which, coming from Europe and America, will pass through that great city, and be met by the commerce of the great Asiatic nations."

THE FIRST SHEET OF PAPER made in the Southern hemisphere, was recently turned off by Prince Alfred, during his visit to Melbourne. It was accomplished at the inauguration ceremonies of the starting of the first mill in Australia.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On orders not exceeding \$20.....10 cents.
Over \$20 and not exceeding \$50.....25 cents.
No fractions of cents to be introduced in an order. United States Treasury Notes, or National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained. Post offices where Money Orders are obtained will furnish blanks as follows, which the applicants will fill out: No. Amount Date, 186

MONEY ORDER.

Required for the sum of \$.... Payable at State of Payable to Residing at State of Sent by Residing at State of ENTERED IN REGISTER; Postmaster.

The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise his initials may be used. The given names of married women must be stated, and not those of their husbands. For example, Mrs. Mary Brown must not be described as Mrs. William Brown.

Names of parties and places, and the sums, to be written in the plainest possible manner.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

THE BEST IN AMERICA.

The Mining and Scientific Press,

is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (8 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. It contains a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

Resolved, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3; in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the PRESS is unsurpassed. Rates moderate.

SPECIMEN NUMBERS OF THE PRESS and Patent Circulars, sent free.

DEWEY & CO.,

July 1st, 1867. San Francisco.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Rates of Subscription:

(Invariably in advance.)

One year.....	\$5.00	Six months.....	\$3.00
Three months.....	\$2.00		

TERMS TO CLUBS:

Three copies one year.....	\$12.00
Five copies one year.....	18.00
Ten copies one year.....	35.00

An extra copy free for one year to the person sending a club of ten subscribers.

Send money to our office in registered letter, or by Express, Address,

BROOKS & CAPP,

San Francisco.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or to neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

 tained orders for passage from Liverpool or Southampton
 to San Francisco, either via New York or St. Thomas—
 if desired an amount of £10 to £20 will be advanced with the
 above orders. Holders of orders will be required to identify
 themselves to the Agents in England.
 For Merchandise and Freight for New York and way
 ports, apply to Messrs. WELLS, FARGO & CO.
 The Steamship CHINA, Capt. E. W. Smith, will be
 dispatched January 15th, at noon, from wharf, corner of
 First and Brannan streets, for YOKOHAMA and HONG-
 KONG, connecting at Yokohama with the steamer COSTA
 RICA for SINGAPORE.
 For passage and all other information, apply at the Pacific
 Mail Steamship Co's office, corner of Sacramento and
 Leidsdorff streets.
OLIVER ELDRIDGE, Agent.

ENLARGEMENT
 OF THE
American Journal of Mining
 Volume III, Commencing March 3.

In consequence of the remarkable success that has at-
 tended this Journal, the proprietors feel warranted in in-
 creasing its size to

Twenty Pages,
 Thus making it the LARGEST and most COMPREHENSIVE
 Mining Journal on this continent, representing the Gold,
 Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all
 the Mineral interests of America, containing beautiful en-
 gravings, illustrating the latest improvements in mining,
 mining and metallurgical machinery.
 The Journal has won the encomiums of the press of the
 entire country and Europe, and numbers among its con-
 tributors more eminent scientific men than any other
 weekly publication in America.
 The reports of the markets in stocks, metals, minerals
 and ores, carefully corrected weekly, are an important
 feature of the Journal.
 Subscriptions: \$4 per year; for six months, \$2.25—in ad-
 vance; single copies, 10 cents. Specimen copies sent free.
 Address, WESTERN & COMPANY,
 1v15-1amly Publishers, 37 Park Row, N. Y.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces, and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
San Francisco.

Hunt's Double-Action Pump

cheap, durable, strong, and not liable to get out of order. Built and on hand at No. 23 Second street, and 108 Jessie street.
14v15tf
E. O. HUNT, Prop'r.

STEWART'S
CELEBRATED HINGED
Grinder and Amalgamator.

The Cheapest and Quickest Pan now used.

It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the muller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect of heating the pulp. E is the muller plate, F the Grinding Shoe, attached by an adjustable hinge joint in the middle in the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.
14v15-lamtf

PATTINSON'S
HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

THOMAS PATTINSON

Brodie's Patented Improvements

FOR THE TREATMENT OF
Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... \$600

No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius-bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:—

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1886.

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I give me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium in the Fair of the Mechanics' Institute in San Francisco in 1884. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel for a longer term than twelve months. All persons desirous of compromising, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1886.

BRODIE'S PATENT WIND-RAST SEPARATOR FOR DRY CRUSHING.

This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1886.

JAMES BRODIE, Fulton Foundry, or CHARLES RADCLIFFE, Express Building, 402 Montgomery street, San Francisco.

E. O. HUNT,
Manufacturer of
Windmills, Horse-Powers
Pumps, Pumping
Frames and
Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order.

2v15y
San Francisco.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND PLACER MINERS, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest Free Gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address
Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,
With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,
Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office

A CHEAP OIL MILL.—The Santa Clara *Argus* describes a cheap oil mill, recently erected in that neighborhood, by Dr. McDaniel. The mill has been erected for the especial purpose of expressing the oil from the castor bean, which the Doctor is cultivating to the extent of about 80 acres. When ripe, the beans are gathered and spread out on a large floor, where the pods are dried, so that the bean drops from the hull. They are then passed through a common fanning mill, after which they are placed in quantities of about 80 pounds to a charge in a strong iron cylinder, where they are subjected to a powerful screw press, worked by horse-power. The *modus operandi* is new, having been devised by the Doctor himself. The press is lined with zinc, perforated to admit of the oil passing through between the lining and the press. The oil then slowly drips into a bucket. It is then taken and passed through a strainer like an ordinary fine sieve, falls into a tank, and is thence taken to a large cylinder and boiled in water for 15 or 20 minutes, and ultimately transferred to the "bleachers" or "clarifiers." These are constructed on the principle of horticultural hot-houses. The sun's rays falling on the glass, soon clarify the oil and render it transparent. It is then put into five-gallon cans, sealed, and transported for sale. The whole process is very simple and cheap. During the winter, the beans cannot be dried in the open air, so the Doctor is constructing a large barn where he can employ heated air for that purpose.

CAN STORMS BE FORETOLD.—Speaking of the recent tremendous hurricane in the West Indies, the *New York World* says:

"Various theories of these, which every few years devastate the West India Islands, have been broached from time to time. The one most generally accepted now is that they are hurricanes which have a progressive as well as a rotary motion, and generally rise in the Gulf of Mexico, gather fury as they proceed, and follow the course of the Gulf Stream until their force is extended. The precise cause of them, beyond the general theory of atmospheric currents and equilibrium, meteorology has failed to ascertain, yet it would seem, with the data at hand, that some more satisfactory solution than this might be ascertained. It is not likely that they originate very suddenly; there must be atmospheric indications of their approach, and it would seem to be as much in the interest of humanity as of science to investigate these indications, if for no other purpose than to obtain the requisite information for forewarning of their approach those who live within the track of such terrible hurricanes.

PAINT POISON.—A correspondent of the Paris Academy of Sciences, states that the poisonous properties of lead paint are due to the turpentine which is mixed with it, not the lead. This opinion is antagonistic to the commonly received one. It is undoubtedly correct, however, in this way: The turpentine is volatile, hence it may lift some of the lead when evaporated, and thus the metal be inhaled by the painter in the form of mineral gas. The correspondent above alluded to asserts that if turpentine were not used, paint poison would be unknown. Other cloying substances, such as the ordinary hydro-carbons obtained in the distillation of coal oil, are equally as deleterious as turpentine, and probably for the same reason.

GIGANTIC JUNIPER TREE AT YO-SEMITE FALLS.—We learn from Mr. Hutchings, of Yo-Semite Valley, that he recently achieved the supposed impossible feat of ascending to the summit of the "Cap of Liberty," 2,000 feet above the Valley, and one of the striking features of that wonderful locality. On the top of this battlement of nature, he found a group of eight juniper trees. One of them measured ten feet two inches in diameter, and is, according to the books, the largest tree of this class in the known world. The others of the group varied from five to eight feet in diameter. The juniper does not, we believe, ordinarily exceed 18 or 20 inches in diameter.—*Mariposa Mail.*

GLANDERS IN MEN.—Dr. Guyon of Paris, has written a paper for the Paris Academy of Science, to prove that the disease of glanders can be transmitted from the horse to man. The Doctor relates cases which came under his own observation.

A PRINTING PRESS is said to have been discovered in an underground vault in India, which must have remained there upwards of a thousand years.

BELLS are of ancient origin. An Eastern patriarch tells a story of a bell that was cast by Tubal Cain, and with which Noah was wont to summon his band of ship-carpenters to work upon the ark; and Moses records that the blue ephod of the high priest of Israel was bordered by a "golden bell and a pomegranate, a golden bell and a pomegranate upon the hem of the robe round about;" and so thereafter the ancient Persian kings went adorned and tinkling in their royal robes. Hand bells summoned the Greek soldiers to their duties in camp and garrison. They were used in the fish market of Athens, to call guests to feasts, and were sometimes used in religious ceremonies in the temples. But by far their saddest province was to hang about the neck of the criminal condemned to death, on his way to execution, "lest innocent persons should be defiled by touching him;" from which Greek custom is said to have arisen the Roman one of fixing a bell and a scourge to the Emperor's chariot, that in the splendor of his power he might be reminded of human misery, and admonished against pride.

It is an old supposition, that the use of silver adds much to the sweetness of a bell. It was the monk of St. Gall, who, being praised by Charlemagne for the beauty of tone of a bell he had cast, replied: "My lord emperor, command a great quantity of copper to be brought me, which I will purify by fire, and let me have silver instead of tin, and I will cast you such a bell that this, in comparison with it, shall be mute." But the cunning workmen of the present day have discarded the ancient belief in sweetening the tone of bell metal with a little silver, as a man would sweeten a cup of coffee with a lump of sugar. Says one of them: "This is a dream. Silver, if introduced in any large quantity, would injure the sound, being in its nature more like lead as compared with copper, and therefore incapable of producing the hard, brittle, dense, and vibrating amalgam called bell metal. There are, without doubt, various little ingredients which the skillful founder employs to improve his composition, but these are secrets to the craft, and peculiar to every separate foundry."

IMPROVED GIMLET.—Every one who uses the common gimlet knows that it is almost impossible to bore a hole with it without splitting the materials. Besides this, in hard woods, the tool works very unsatisfactorily, as the screw on the end draws out before the hole is completed. In any case the action of the gimlet is defective from the manner in which it is constructed. It is not a cutting tool, but performs its work by crowding or forcing the wood to one side.

Mr. E. P. Watson, of New York, has hit upon an invention, the object of which is to produce a gimlet that will bore without splitting, and cut as true a hole as an augur. In this instrument, the tapering portion is provided with a series of shoulders which form cutting edges, and removes chips as the screw on the end draws in. The object is attained perfectly, and the result is a much better tool at little additional cost of manufacture, and can be applied to gimlets already manufactured, either double or single cut. The advantages of this gimlet are apparent.

GOLD MINING IN ITALY.—The remittance of 1,308 ounces of gold from the Pastarena mines has realized \$4,293. As yet none of the advantages to be derived by the amalgamation has been experienced, and none of the rich ore has been treated. The ore treated since March 31st, by the native mills, has yielded an average of 2 ozs. 6 grs. of gold per ton, and some of the ore now being raised from the Aquavite bottom level will yield six ounces per ton.—*London Mining Journal.*

The trade in amber is becoming more extensive every year at Memel. The diggings in the Samlan, the district between Konisberg and the Baltic, recently yielded 5,300 pounds in one year.

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thanks for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness:

MEERSTADT, January 22, '67.
Messrs. Dwyer & Co.—Sirs: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Letters Patent" on my application through you for an "Improved Machine for Washing Ores." It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf.
Very truly yours,
M. A. WOODSIDE.

WATCHMAN.—Mr. Henry S. Smith, of the *Ætna Iron Works*, was "cornered" in the office of that establishment, on Christmas Eve, and compelled to stand and deliver, no, receive an elegant gold watch and chain, which the machinists and men under his more immediate charge had procured for that purpose. A very neat and appropriate presentation speech was made, in behalf of his associates, by Mr. George A. Atwood, as follows:

MR. SMITH:—We have assembled here to-day for the purpose of making the emotions of our hearts known to you. It has, for some time, been our intention to express them, but before the present, no favorable opportunity has presented itself. Knowing as we do, the never-ceasing trials and provocations which besiege you while pursuing your monotonous duties, and feeling within ourselves that some demonstration of our appreciation is due to you, whose life and energies, thus far, have been devoted to and for the benefit of the occupation we now follow. We well know that all employers, and all foremen, object seriously to being watched by their men, and most assuredly they would object to being chained in a free country. (I must remark, that it would take a very expert watchman, and a long chain, to keep run of you most of the time), but in this case the hands find time, without opposing the will of the person watched. We have ever found you ready and freely willing to assist us in all our embarrassments, and under your management and control, you have made our daily avocations comparatively a pleasure, and by showing that you understand and appreciate the exertions of those around you, you have won to yourself their entire confidence and regard. Therefore, permit me, in behalf of my shopmates assembled, to present you with this watch and chain. May it, through life, serve to remind you of the feeling existing in every honest breast around you, and as you look, from time to time, upon its dial, may it bring to your mind the feeling of pleasure it is intended to convey.

The recipient was taken completely by surprise, yet made a happy acknowledgment of the gift, more, however, by acts than by set phrases and words. The watch is of American manufacture, as all watches worn by Americans should be.

PUTNAM'S MAGAZINE.—One of the most pleasing announcements of late, in the literary world, is the promise that the once favorite Putnam's Magazine was to have been revived on the 1st of January. Those on this coast who remember what that magazine was in former times, will be pleased to learn that they will soon be able to renew those pleasant and profitable readings. Messrs. Bancroft & Co., of this city, will be the exclusive publishers for the Pacific coast. It will be the aim of the publishers to make this magazine "solidly useful," and a "medium for positive and accurate information," while at the same time it will be "a live and entertaining visitor." It will be sustained by the best writers in each department, and will be furnished at \$4 per annum in gold coin—post paid by the publishers. Two copies to one address, \$7.50. Address Bancroft & Co., San Francisco, Cal.

[Since the above was in type, we have received the initial number. The promptness with which the public are served on this distant coast, augurs well for the spirit and energy of the publishers.]

Our Patent Agency.

THE PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage that can be secured to them through a competent and responsible agency upon this coast.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES.

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (7 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (4 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO. Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M. & M. CO. (3 Concentrators).....	Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Siueala, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SAN FRANCISCO, October 10th, 1867.
SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co., }
VIRGINIA CITY, Nev., Sept. 17, 1867. }

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

CHURCH AND STEAMBOAT

BELLS,

TAVERN AND HAND BELLS AND GONGS,

FIRE ENGINES, FORCE AND LIFT PUMPS,

Steam, Liqueur, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Orange Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, &c.

HYDRAULIC PIPES AND NOZZLES

For Mining purposes, Iron Steam Pipe furnished with Fittings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal".

—Highest Market price paid for OLD BELLS, COPPER AND BRASS.—

PACIFIC

BARREL AND KEG COMPANY.

Having now in operation extensive and improved Machinery for the manufacture of

BARRELS AND KEGS,

Are prepared to contract

AT LOW RATES

For supplies of such stock as may be required. Will also contract for

Stave Timber,

Of different kinds, delivered here, or at any shipping point in the Interior, or upon the Coast.

Orders and communications to be addressed to

FLINT, PRABODY & CO.,

Agents Pacific Barrel and Keg Co.,

23v15-3m 498 California street.

UNIVERSITY COLLEGE SCHOOL OF MINES.

Corner Geary and Stockton streets.

ON THE SIXTH DAY OF JANUARY, 1868,

A course of Lectures on

Chemistry, Metallurgy, Mining and Geology,

Will be commenced, and continue for four months from date. The special objects of these Lectures will be to afford those practically engaged in Metallurgical and Mining pursuits, full and complete information on all points bearing on the useful minerals of this coast, together with practice in the Chemical and Metallurgical Laboratories.

Price for the full Course of Lectures and Practice in the Laboratory, \$120.

Terms for Lectures alone, \$10 for each subject

For particulars apply to

THOMAS PRICE,

University College, San Francisco.

SIXTH INDUSTRIAL EXHIBITION

UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE,

SAN FRANCISCO.

The undersigned, acting under authority from the Mechanics' Institute of the City of San Francisco, take great pleasure in announcing to the public that they have resolved upon holding an Industrial Exhibition in the month of August, 1868, on a much larger scale than was ever before attempted on this coast; and they make this early announcement of their intention, that all who may desire to participate shall have ample time for preparation.

A programme, embracing rules and regulations for the government of participants, with a list of Premiums to be awarded, etc., is receiving such earnest and careful attention as the importance of the enterprise demands and in due season the same will be made public by circular letters widely distributed, and by advertisements in the leading journals of this coast.

Executive Committee:

GEO. K. GLUYAS,	P. J. O'CONNOR,
THOMAS YOUNG,	EDWARD NUNAN,
D. E. HAYES,	GARDNER ELLIOTT,
HORACE D. DUNN,	H. F. WILLIAMS,
GEO. T. BOHEN,	C. M. PLUM,
H. ROSEKRANS,	J. A. PRITCHARD,
C. H. HARRISON,	WM. J. LEWIS,

Paper Boating; New Uses.

Disengaging Boat Tackles.

Much attention has been directed, during the past two years, to devising more perfect arrangements for the instantaneous disengagement of boats from their tackle, when required to be let down at sea, especially

than half the boats of a crowded ship have often been thus destroyed, with their human freight, which casualties might have been totally avoided by the use of any one of several disengaging devices invented during the last two years. We have already fully described and illustrated a California

Fig. 1 represents the apparatus as attached to a boat as the boat is suspended to the davits of a vessel.

In Fig. 2 is shown a section of the boat, and A, B are the rods running under the gunwale of the boat, through thimbles or eye-holts secured to the side of the boat;

the forward and after ends of these rods pass through sockets, C, C, secured to the stem and stern of the boat, for the purpose of receiving the links, D, D, into which the tackles, E, E, are hooked. The other ends of the rods are attached to a lever, F, which is pivoted amidships. To disengage the boat all that is necessary is to lift the lever F, and the rods, A, B, are drawn back out of sockets, C, C, liberating the links, D, D, and the boat evenly descends into the water.

Fig. 3 is an enlarged view of the socket with the shackle disengaged.

The arrangement is *positive* in its action; it cannot be operated wrong. The lever which operates it being seated in the throat of a knee on the top of the thwart, cannot be forced down; if lifted up it is sure to disengage the boat. The apparatus cannot be obstructed by ice, as it is placed in the upper part of the boat, under the gunwale. To prevent corrosion the rods and levers are galvanized, and the sockets and eye-bolts are made of composition. In putting on the apparatus, the length of the rods may be adjusted by the right and left screw-coupling, G, G, so as to make them of equal length in the sockets, and to permit them to draw out about an eighth of an inch clear of the shackle.

This apparatus has been approved by the United States Board of Supervising Inspectors, and after numerous trials by the local inspectors of steam vessels in Boston, and in presence of some of the most competent engineers, mechanics, and steamboat captains, it has been pronounced a most *sure, simple, and effective* arrangement.

At a trial of the apparatus on three life-boats belonging to the G. B. Upton, twelve men were placed in the center of the boat, and then again at one end of the boat, while it was suspended; and at each time both ends of the boat were liberated simultaneously from the tackles in the most perfect manner. Trials have been made with the apparatus on board the boats of a large number of steamers with equal success.

Donald McKay, the eminent ship-builder of Boston, speaks in the highest terms of the value and efficiency of the device. The invention was patented Jan. 22d, 1867, by I. S. Hall, of Boston, and Andrew Burnham, of Chelsea, Mass. It was first described and illustrated in the *American Artisan*, of March 13th, 1867. The invention is now owned by Nathaniel McKay of East Boston.

Fig 2

McKAY'S PATENT LIFE-BOAT DISENGAGING TACKLE.

during a gale of wind, or at other times of great or sudden danger. It is well known that many lives are lost in this operation, when, by the imperfect modes of disengagement heretofore universally employed, rendered still more dangerous by the hurried mode of disengaging at such times, one end is held in suspension for an instant longer than the other. The consequence is that a boat so disengaged goes down endways, or at a plunging angle, which either spills the unfortunate crew into the sea, or so drops the boat that it plunges headlong beneath the waves and is swamped at once. More

invention of this kind, which was patented through this office, and which has met with great favor at the East and in Europe. We herewith append an illustrated description of a more recent invention, known as McKay's Disengaging Tackle for Life Boats, by the employment of which both ends of a boat may be simultaneously released, and with its complement of passengers safely dropped into the water, while the vessel is under speed, or otherwise, and by which boats can be launched safely by day or by night, under any circumstances, without peril to life.

California Silver-Gold Tellurids.

MESSRS. EDITORS—The MINING AND SCIENTIFIC PRESS of Jan. 4th, 1868, contained an abstract of a communication of Professor Silliman to the California Academy of Sciences, relative to the occurrence of Tellurium in California. Prof. Silliman alludes to the telluric gold found at the Melones mine, on Carson Hill, and suggests that the tellurium mineral detected by him at the Golden Rule mine and at the Raw Hide Rancho mine, is identical in appearance and physical characteristics with the Melones minerals.

It is further stated that the tellurids, mentioned above, appear to be referable to a new species, *hitherto undescribed*, and that the mineral contains more silver than gold. It is a mistake in Professors Dana and Brush to suppose that these tellurids, especially those found in the Melones mine, which are more particularly referred to, have not been heretofore described.

Some two years ago I had occasion to examine the telluric gold of the Melones mine, the result of which appeared in the MINING AND SCIENTIFIC PRESS, May 20th, 1865. The proportion of gold and silver differs very much from the known telluric gold minerals, analyzed by Klaproth, Borellius etc., also its chemical and physical properties differ from the *Sylvanite*, so as to characterize this mineral as a new species. A remarkable appearance of the telluric gold from the Melones mine, is its changing of color from the dark steel gray into yellow, when a small fragment is placed on a hot coin, or cautiously heated with the blow-pipe on a piece of charcoal, so as to avoid smelting; under the microscope the surface of such a fragment appears thickly coated with pure gold globules; hence its yellow color.

The specific gravity is 9—9.4. It contains—

Gold.....	24.80
Silver.....	40.60
Tellurium.....	35.40 (7)

Owing to the great variety of minerals found in the ore of the Melones mine, only small fragments of the pure telluric silver-gold could be obtained, and for this reason the analysis was made by means of the blow-pipe. The result, however, is given as an average of seven samples, carefully assayed, the variation of which was inconsiderable. The tellurite of the silver-gold is accompanied by tellurite of silver, native tellurium, antimonial nickel, iron pyrites and free gold.
G. KUSTEL.

Communications.

In this DEPARTMENT we invite the FREE discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER EIGHT.

INCONVENIENCES ACCOMPANYING THE EMPLOYMENT OF CHLORINE IN SOLUTION WITH BRINE.

It has already been shown that in proportion as the temperature of an aqueous solution of chlorine increases from 48° to the boiling point, its power of absorbing that gas decreases; yet, even at 131° it has been shown that the volume of chlorine present in a saturated solution of salt may, when saturated with chlorine gas, amount to an equal volume of chlorine in the gaseous form. The activity of chlorine in solution, notwithstanding it may be present in equal volume, is however very inferior in its action in dissolving gold, as compared with that substance in the gaseous condition. This fact appears to be practically recognized by Mr. Calvert in his whilom recommendation for the reduction of gold ores by means of a solution of chlorine; for, in his paper on this subject, read before "The British Association," he mentions that, in order to expedite the operation, it is requisite to draw off and return the solution repeatedly (four or five times), in order to produce the fullest and most rapid effect. The only comment on this that need be made at present, is, that where gaseous chlorine alone is employed, no such repeated withdrawal and recharging is required. The explanation of this difference of action is simple, but would be very lengthy, and therefore must be overlooked for the present.

It will suffice for present purposes to call attention to the fact previously explained that 1,000 lbs. of water, saturated with salt and chlorine, would hold in solution, at a temperature of 131°, sufficient of the latter to dissolve \$1,700 worth of gold.* Taking the present yield of Comstock ore as typical of the bulk of mixed silver and gold ores, other than those containing large quantities of antimony or lead, or both, it may be safely taken as the basis of calculation that such do not, by fire assay, contain on the average more than \$50 worth of bullion per 2,000 lbs. of ore—distributed between the two metals as follows: \$40 silver, \$10 gold. Now to leach out the \$40 worth of silver, according to the example above quoted from Rivot, would require 2.625 tons solution, or 5,250 lbs. If amongst this great mass of solution half an ounce of gold, or, in other words, two hundred and forty grains (\$10 worth, or half an ounce troy) is disseminated, it would be in the ratio of one grain to 153,166. Even in laboratory practice the tediousness attendant on the precipitation of the ter-chloride of gold, even when in the ratio of one in 40,000 is well known; if such is found to be the case when working only with test tubes and spirit lamps, it may be conceived how enormously this tedium will be increased when such a diluted solution has to be treated by tons. Further, it is well known that when one grain of gold is dissolved in the ratio of 100,000 grains of solution, its precipitation, when acting with quantities, is practically an impossibility. As 5,250 lbs. equal 36,750,000 grains, it follows that the latter figures contain 100,000—a little over 367 times; in other words, more than would suffice in practice to retain in solution all the gold contained in such ore, unless further concentrated. It is quite true that the inconvenience last pointed out is one that may be in a considerable degree avoided by employing the chlorine solution

only, either in the first or last instance, and retaining such solution separately after being drawn off; but, even if disseminated only through half a ton, which is the lowest possible estimate that can be made, that quantity would retain 70 grains in solution or \$2.80 worth of gold, rather more in fact than 25 per cent. of the total value of the gold present in the ore; whereas, by careful management in the employment of chlorine in the gaseous form, the whole of the gold may be obtained in solution, not exceeding twenty pounds in weight, in which comparatively concentrated condition the precipitation by means of the ordinary precipitant (proto-sulphate of iron) would be rapid, the gold being present only in the proportion of one in 566, and the total gold in solution incapable of becoming precipitated would amount to little more than one grain, or say five cents in value, in place of \$2.80, as shown by the former example, thus forming a direct saving of gold equal to \$2.70 per ton, by employing gaseous chlorine in place of being in the state of solution.

CASES WHERE THIS METHOD MIGHT BE ECONOMICAL.

Allusion has already been made to the fact that cases may occur where the copper present in the ore, as an accompaniment of gold and silver, is in sufficient amount to make its reduction also an economical object, that this method may be advantageously adopted with such ores, and that such are probably some of the varieties alluded to by Mr. Kustel as having been so treated with advantage by Patera and Roeszner. It was at the same time named, that certain varieties of auriferous and argentiferous ores might possibly be advantageously reduced by brine and chlorine, simultaneously employed. In order to make these latter cases better understood, it will be well, in the first place, to note the difference between the varieties alluded to, and the great bulk of the ores containing gold and silver found in the various districts in which we feel more specially interested; first, as respects—

California Gold Ores.—These usually produce the metals named in the form commonly denominated 600 to 900 fine, the latter being rather rare, and the former comparatively so. The bulk may be taken at an average of 850, if such ores were strictly analyzed. That, in many cases, the gold obtained in battery, amalgamation is finer than above set forth, is freely admitted. The reason, however, for the fact arises from a circumstance, which, I think, has been wholly overlooked by all but the writer, viz: that from causes, the reason for which he strongly suspects, but which he is not enabled positively to assert as a fact, that in what is commonly known as the losses sustained by "float gold," no inconsiderable portion is caused, in a great measure, in consequence of being accompanied by silver in the proportion (by weight) of from two, and occasionally three of the latter, to one of the former. I may further add that the float silver here alluded to very probably is in the state of chloride. On some future occasion I may, perhaps, dwell more at length on the important subject just glanced at, as it forms no inconsiderable source of the losses sustained in connection with the preparatory indispensable pulverization, and the further not less important, though almost utterly neglected, concentration of ores prior to subsequent treatment.

It may be pretty safely affirmed that, with California gold ores, silver exists in combination with the gold in the form of an intimate alloy of from one to five-twelfths of the weight of gold. In many instances, however, although an assay button would show the latter named proportion, it would be a wrong inference to conclude that, consequently, such must be the actual alloy of the metals when existing in the state of ore; for it occasionally, and not very unfrequently, occurs in this State and many other countries that the quartz not only contains pyrites, but galena (sulphide of lead) also; in which case it will generally be found, on assaying, that the silver combined with the gold greatly predominates.* With such ores, it would therefore be wrong to infer, merely because the assay button is found to consist of an alloy largely mixed with silver; therefore, the same method for reducing the ore from which it was obtained is the appropriate one, which may be well adapted to attain the same object in cases where the gold and silver actually exists as an alloy, consisting largely of the latter metal. Thus, gold rock may contain gold as an alloy in which silver exists only as one-twenty-fourth part; yet, a button may be obtained from such ore by fire assay, showing an alloy in which silver may probably exist in the ratio of ten parts out of twenty-four, the extra nine parts having been de-

rived from the galena present in the ore. The illustration just given will probably be the means of satisfying reflecting minds that, in order to produce the most beneficial results, change of method is required according to the character of the ore; and further, that in order to arrive at a correct conclusion as to what would be the best method under a given set of circumstances, an analytical investigation is not unfrequently required much beyond that of making a mere mechanical assay.

Electrum.—A native alloy of gold and silver is occasionally found in which these metals exist as an alloy in atomic proportions, that is, 108 parts silver, combined with 199 parts gold.* This alloy was named by the ancients *electrum*. It is a rare substance, and is found most frequently in the mines of Hungary and Transylvania, occasionally mixed with a slight amount of copper. I suspect that it was this alloy which was chiefly alluded to by Mr. Kustel as the ore employed in the experiments of Patera and Roeszner, and those of Mr. Poumares, alluded to by Dr. Lanszweert; possibly, however, in so divided a form, and intermixed with that variety of sulphides which, in consequence, has acquired for them the title in California of rebellious, and with experts that of refractory ores; so much so that simple amalgamation is found insufficient for their reduction; as, otherwise, I cannot conceive why this alloy could not be extracted by means of mercury without any preparatory process, chlorination appearing to be particularly undesirable in such circumstances. If, however, the *electrum* existed as an alloy, in which both metals were combined in a mineralized condition, it is quite conceivable that the method, as described by Poumares, might prove the most effective.† In such a case, the chloride of silver would evidently form a film over the gold, unless dissolved as quickly as it was formed by some menstrua, such as hot brine; which film, however, would be perpetually, but slowly, renewed by the chlorine in solution, and as constantly requiring removal. In such cases, perhaps chlorine in solution, in hot brine, will be found the most expeditious and economical process. Ores of this class, however, so far, have not been found; or only sparsely, in Nevada and California, as may be gathered from the following sketch of the physical condition of the gold and silver, when found in conjunction in the—

Comstock and Similar Sulphureted Silver Ores.—In which the gold almost invariably exists in the metallic condition of gold, alloyed only with about one-tenth of its weight of silver, although when the whole of the hullion is reduced and formed into one mass, the alloy obtained is usually found to consist of only from one-fiftieth to one-sixtieth of its weight of gold, the balance being silver. I have not had the opportunity during the last five years of personally ascertaining whether the facts just stated are fully sustained at the present moment; but, at the time indicated, I can truly aver that in every analysis made by myself on Comstock ores, in order to obtain an insight into the physical condition in which the precious metals existed, either alone or combined, the facts above stated were found to invariably occur; and from the inspection of some highly concentrated tailings recently furnished me from the same quarter, I do not see any reason to suppose that the facts are changed. The only features that have changed in connection with that celebrated vein (for I hate the misleading term, "lead,") since its discovery, are that as the vein became developed in depth the ores became gradually poorer, the gold becoming so in an accelerated ratio; thus fully confirming what I predicted in 1859-60, in the columns of the *Evening Bulletin*, and have repeatedly asserted since. This warning, in place of being heeded, has been treated with contempt. The consequence of neglecting which has been that no precautionary steps have been taken to meet the emergencies required by the coming state of things, which was certain to arrive; the result of which is now being seen in the larger part of the mines situated on this vein becoming assessment in place of dividend paying ones, and the whole are rapidly approaching the former described condition; instead of which, a reversed condition of things ought to have existed, and would in future be reversed, if those interested would only act with ordinary discretion.

[In somewhat too hurriedly drawing up the paper which appeared on the 28th ultimo, it was omitted to mention the amount of chlorine which would be absorbed by brine of a temperature of 131°. This omis-

sion I had rectified in a manuscript which was in the hands of the Editor of the MINING AND SCIENTIFIC PRESS on the Monday preceding the appearance of Dr. Lanszweert's letter of last week. Had Dr. L. taken the trouble of examining the figures given by me in that article, as to the estimated amount of chlorine which would be absorbed by brine of a temperature of 131° he would have discovered that I deemed it sufficiently near for calculation, to estimate the absorbability of chlorine under such condition, as equivalent to a volume of gas to the volume of solution employed.

To other extraneous observations I shall reserve my reply until this series is finished. In the meantime, if a difference exists respecting quantities and values, I wish common and well understood standards to be adopted, viz: a ton of 2,000 lbs. and values at dollars and cents; as these are the terms more generally employed by practical men. I may now observe that jocular remarks are not petulant ones, though the joke may be a lame one, which I admit mine to have been. Next, *warm* is a term employed to indicate a temperature lower than a *hot* one.]

"Formation, Distribution and Age of Igneous Rocks."

EDITORS PRESS.—It has ever been the way that new and important truths, either in the broad fields of science or theology, have had to displace errors grown venerable with age or precedent. Before the manuscript, under the above heading, left my hands, I remarked to a friend, that while I was thoroughly convinced of the correctness of the idea of an eruptive era of metaliferous quartz, and of its being perfectly in accordance with the plan of the distribution of igneous rocks; yet I anticipated that a certain class of school-men, who seem to be quite numerous, and who have much to unlearn, are so committed to false theories that they contest its general adoption inch by inch. I have a few text-books on chemistry, which have been my companions and advisers for a score of years, to which have been added, from time to time, text-books on astronomy, geology, mineralogy, etc.; and, beside, I have the great Book of Nature before me, and have dwelt amongst the Sierra Nevada the best part of sixteen years, and yet have not arrived at the conclusion which "Criticus" indicates. On the other hand, it is some years since I became aware that the geology, or the geognosy, of metal-bearing veins, and of the more ancient auriferous deposits of the Sierra Nevada, had never been written. Moreover, I have sought the truth diligently, and think I have a tolerably clear perception of it.

I challenge "Criticus," and the school of scientists to which he belongs—the whole generation of them—to show, if they can, that there has not been a period in the past history of the earth when metal-bearing quartz was erupted, and that it did not occur during the old red sandstone era. His or their efforts in this direction might be very instructive; possibly they might prove to be very amusing. If I failed in my recent endeavor to make my conceptions of the plan of the distribution of igneous rocks intelligible, I indulge the fancy that the above challenge is reduced to terms which *may* come within the range of "Criticus'" comprehension. Meanwhile I trust it will be considered pardonable in me if I should not place full confidence in all of the assertions of "Criticus," against my own convictions, especially when those convictions are fortified by years of earnest study. "Criticus" may have occasion to suspect that he is not so *thoroughly* conversant with the operations of nature, after all, long before he gets through with the little job above indicated.

F. A. HERRING.

Forbestown, Dec. 31, 1867.

IS A QUARRY A MINE.—A late and important English suit hinged on the question whether a quarry worked for slate, was a mine, (the question being a bequest of mining interest.) The judge decided that inasmuch as the quarry was worked chiefly underground, it was a mine. If it had been worked altogether above ground, it could not be considered a mine.

* Provided the gold is in a sufficiently divided form. When the gold is coarse, chlorine is far from being so effective.

* So generally is silver only found in galena that it was, until about three years ago, asserted by San Francisco-called experts, that gold never was found in galena.

* Klapproth gives the assay of *electrum* as 64 gold, 36 silver. Ruse, for that found at Vorospatak, as 60.49 gold, 39.51 silver.

† It is difficult to conceive how gold could, even as a silver alloy, exist in such a mineralized form.

Mechanical.

CHEMICAL CHANGES IN IRON.—The tendency of iron to pass from fibrous or tough to a crystalline or brittle condition, is promoted in various ways. It is recorded that Dr. Nood, once seeing a large quantity of iron chain lying about, and learning that, though but little worn, it was laid aside in consequence of the breaking of some of the links, he examined several from different parts of the chain. In the course of his observations, he noticed that a single smart blow with a hammer was sufficient to snap the metal into pieces, the fracture of which showed a highly crystalline appearance. The Doctor then submitted portions of the broken links to a strong heat, in a forge, and allowed them subsequently to cool, very slowly, under a bed of fine sand. After the lapse of twenty-four hours, the metal is said to have recovered its tenacity to such a degree, that it could no longer be readily broken under the hammer; and when it did finally yield under repeated blows, it was found to be quite fibrous—all trace of its crystalline structure having disappeared.

It is well known that constant and long continued repetitions of heating and cooling of fibrous iron will render it crystalline. We are told by a gentleman who has had much experience in the use and sale of caloric engines, that the greatest drawback to their use arises from this very peculiarity of iron. Parts of the caloric engine, it is well known, become very hot, when working, and, of course, cool down when the engine stops. A constant repetition of these changes of temperature, as in an engine working only during the day, soon destroys the parts exposed to such changes. This result is, probably, due to the mechanical action of expansion and contraction in the changes of temperature—the same being somewhat analogous to that of vibration.

PAPER BELTING.—Machine belting is now being manufactured from paper by J. B. Crane, of Dalton, Mass. Most of the machinery in Mr. Crane's mill is run with paper belting, and the large driving-belt in Col's mill at Pittsfield, Mass., is of the same material. Mr. Crane has made a paper belt seventy-five feet long and eight inches wide. The paper belting is said to have all the merits of leather and some advantages. Time only will attest the truth of this assertion.

OTHER NEW USES FOR PAPER.—A new process has been discovered by which paper can, by chemical and mechanical influences, be rendered as hard as hickory wood, and may be manufactured into a variety of articles hitherto made of wood, tin, copper and iron. The substance produced is a non-conductor of heat, impervious to the action of acids, and not liable to be injured either by heat or cold. It can bear a heat of 300° Fah., without injury. When the preparation is soft it is shaped in molds and water pails, wash-basins, pitchers, etc. When further improvements are made articles formed of paper will come in competition with crockery and china. The White House and the Departments in Washington have already been supplied with sets of paper water-pails, ice-coolers and spittoons. A factory at Greenpoint, L. I., is now engaged in developing the process, which of course is a secret.

INVENTIONS KEPT SECRET.—Mr. Bessemer has worked in secret for many years an invention which he felt he could not patent in safety. No one but the inventor and two of his nearest relations has ever seen this machinery. The manufacture has proved highly remunerative, and Mr. Bessemer now enjoys a monopoly of the article manufactured.

One of the largest firms in Birmingham, Eng., employs very ingenious machinery in the manufacture of forks and spoons. This machinery cost an immense sum to bring it to perfection. It is not patented, no stranger is permitted to see it, and the few men employed in working it are paid large wages, and sworn to secrecy as regards its construction.

WINDMILL POWER.—Smeaton ascertained that the effective power of a windmill with sails of the best form, and about 15½ feet radius, with a breeze of 13 feet per second, is about one-horse power.

COST OF EXPERIMENTING.—It is said that the first iron beam ever rolled in America cost \$75,000. When the "Cooper Union" was projected, rolling machinery costing \$20,000 was put up, but found too weak to produce beams of the requisite strength. Experiment after experiment was made, till the money spent in that way amounted to \$75,000, when the work turned out answered the intended purpose. Nine-inch beams have been common now for many years in large fire-proof buildings, but the demands of architecture are requiring greater dimensions, and an engine has been constructed to roll iron beams forty feet long and twenty inches wide. American ingenuity is never at a loss to meet the requirements of advanced civilization.

TESTING SWORD BLADES.—The Austrians test sword blades by machinery. They fasten the sword by its hilt into a frame and submit it with a known and adjustable velocity, to a certain number of strokes at the mid length of the edge against a block of beech wood. The sword is also subjected to a slanting or glancing blow at a given angle and velocity against the side of a cylinder of hard wood. The edge is tested by blows against a piece of wrought iron of a given breadth, and proof of the blade's elastic temper is obtained by bending and suddenly releasing it within certain limits. The peculiarity of these trials is that the nature and extent of every test is determinative and may be made adjustable.

THE PRODUCTION OF IRON.—The yearly production of pig iron by the furnaces of Great Britain forty years ago was a little under 700,000 tons, and that of the United States the same year about one-fifth as much, or 140,000 tons. The production last year may be taken in round numbers for Great Britain 5,000,000 tons, and the United States at 1,250,000 tons, showing an increase, the effect of which upon the whole world cannot be estimated by mere figures. The total product of the world at the two periods may be stated at a little over 1,000,000 tons forty years ago, and 9,000,000 per annum at present.

CASTINGS IN SOFT STEEL.—It is noted as a fact in casting steel to patterns, that a Sheffield (Eng.) firm have cast a hydraulic cylinder eight inches in diameter and two and a half thick, perfectly sound and malleable. The Wm. Butcher Steel Works, Philadelphia, Pa., have recently cast a hydraulic cylinder 12 inches in diameter and but 1½ inches thick, perfectly sound and malleable, which is a much more difficult casting to make, on account of the thinness of the metal.

THE SMALLEST PRACTICABLE RAILROAD CURVE is an arc of a circle whose radius is 720 feet. Consequently a railroad would have to be nine-elevenths of a mile long in order to make a complete circle. A railroad embankment must be three times as thick at the base as its perpendicular height. In other words, the slope, in order to stand without sliding, must not be more than about thirty degrees from horizontal. The highest embankment in the world is on one of our Western roads, 240 feet, with a base 720 feet thick.

THE AGINCOURT'S ENGINES.—Probably the greatest indicated power ever yet exerted in a single pair of engines, was that attained on the recent trial of the *Agincourt*. With a nominal power of 1,350 horses, the indicated horse power was 6,867. With half boiler power, 3,115 indicated horsepower was obtained. The full piston speed, with 61½ revolutions per minute, and four feet four inch stroke, was 533 feet per minute.

THE VELOCITY OF STEAM, when flowing into a vacuum is about 1,350 feet per second, when at an expansive power equal to the atmosphere; but when at ten atmospheres the velocity is increased to 1,780 feet; and when flowing into the air under the latter pressure it is only about 650 feet per second.

A PUTTY of starch and chloride of zinc hardens quickly, lasts for a long time, and may often be advantageously used as a stopper of holes in metals.

The tubes of tubular bridges are generally painted white, so as to increase the radiation, and thereby diminish the effects of contraction and expansion produced by the alternations of the atmospheric temperature.

FRICTION.—According to experiments made by M. Morin, the friction of steel upon cast iron is nearly double that of brass upon brass.

Scientific Miscellany.

Substitutes for Animal Charcoal.

Much research has been expended in efforts to provide a substitute for animal charcoal, for use in decolorizing sugar in the process of sugar refining. Very little success, however, appears to have attended such researches until the recent experiments of Dr. Ziegler. The Doctor's substitute consists of a mixture of kaolin or pure clay and carbon, in place of animal charcoal. The clay is made into a stiff paste with a solution of glue, fat, oil, resin, or even with coal tar. This is made into short cylinders, about an inch in diameter, by means of wooden molds. These cylinders are firmly compressed until they are about half an inch long, then dried and burned in a close retort, to reduce the organic matter to a simple carbon. In order to make the mixture the more porous, common salt or salt of potash is added, which, after burning, is washed out with water.

A filtering substance so prepared is said to be even more effectual as a decolorizer than the ordinary animal or bone charcoal. If such should be the case, the discovery promises, with the various modifications to which it is applicable, to be one of considerable value in the manufacture of sugar, and for other decolorizing or deodorizing purposes.

A Sea-weed Substitute.—In connection with the above, it will be interesting to note the fact that a Mr. Stanford has recently exhibited to the British Pharmaceutical Conference a new kind of charcoal, which appears to possess many valuable properties. This substance consists of the coal produced from the long stems of a species of sea-weed—*Laminaria digitata*—which is thrown up in great abundance in certain localities, especially upon the western shore of the Hebrides. This sea-weed is collected and dried in the air. When first thrown up, it is in the form of long, fleshy stems, seven to eight feet in length, and about the thickness of the wrist, but when dried, presents hard, horny, flexible rods, about the size of the finger. When carbonized, these stems swell out into a highly porous charcoal, about three times their original volume. This charcoal contains about 40 per cent. of salts, free from sulphides, and is very rich in iodine.

After lixiviation, the residual mass has the following composition, with slight variations:

Carbon	60
Phosph. lime	4
Carbonate of lime	26
Carbonate of magnesia	6
Silicic acid	5
Alumina	2
Sulphate of potash	5
Chlor. iodine	5

—and about 1.25 per cent. ammonia.

It generally contains, in addition, about 15 per cent. of water, which it is very difficult to separate, the charcoal having a most powerful affinity for moisture.

Attention was called to the remarkable analogy between the chemical composition of this and of animal charcoal, which appeared to class it with that substance, and render it unlike any other charcoal of a vegetable origin. It cannot be used for sugar refining, on account of the large percentage of carbonate of lime; but it possesses decolorizing and deodorizing properties, superior, weight for weight, to the best animal charcoal; tested with solution of caramel it decolorizes 25 per cent. more than animal charcoal under the same conditions.

It has been subjected to continued filtration of the thickest town sewage, for several months, without the least clogging, and its efficacy after this treatment remained unimpaired.

This communication was merely preliminary, the author promising the results of further investigation on this and other specimens of sea-weed charcoal.

The tangle charcoal was brought before the meeting as a cheap and efficient substitute for animal charcoal in its application other than that of sugar refining; and its introduction excited an interesting discussion.

ACIDS IN SHELL FISH.—M. Dumas, of Paris, affirms that M. de Luca has found in the liquid contained in the living mollusca about three per cent. of sulphuric acid, and that the same mollusca, plunged into water, disengages a considerable quantity of carbonic acid.

CURIOUS EXPERIMENTS WITH PROJECTILES.

Some experiments, recently made by M. Melsen, have excited great interest at the French Academy of Sciences. M. Dumas stated that a leaden ball, falling from the height of about one meter into water, drew with it twenty times its volume of air. The same ball projected by powder to the interior of a vertical cylinder filled with water and closed at both ends by means of plaster diaphragms, carried with it 100 times its volume of air. When the initial velocity of the ball was small, the hole made in the plaster was about the same as the diameter of the ball, but when the velocity was greatly increased, the size of the hole was excessively large, and a double border was formed around the holes where the ball entered and passed out of the cylinder. The cause of the increase of the size of the hole has not been ascertained. These curious results led Melsen to try the experiment of shooting through a pane of glass. He ascertained that contrary to the general belief, a very high velocity of the ball as well as a very low velocity, shattered the glass, while a medium velocity made a smooth round hole.

LIGHTING UP THE STOMACH.—M. Millott, of Paris, has devised a method of introducing light of intense brilliance into the human stomach. He passes into that organ two platinum wires, connected with the poles of a powerful battery, the apparatus of Middeldorff being preferred, and in this way kindles a very bright light in the entire cavity. The principle is the same as that of holding an egg before a bright light to ascertain its condition by its translucency.

It is presumable that the two main wires are of iron, and that they are connected at the part which reaches lowermost in the stomach, by a fine, naked platinum wire. The retardation of the current at that point, so prepared, would produce a light of intense brilliancy.

TO PRINT LETTERS BY SUNLIGHT.—Dissolve chalk in aquafortis to the consistence of milk, and add to that a strong solution of silver. Keep this liquor in a glass decanter well stoppered, then cut from a paper the letters you would have appear, and paste the paper on the decanter, which you are to place in such a manner that its rays may pass through the places cut out of the paper and fall on the surface of the liquor. The part through which the rays pass will turn black, while that under the paper will remain white. You must observe not to move the bottle during the time of the operation. *Chemical News.*

NEW MIXTURE FOR MATCHES.—Prof. Bottger has found that a mixture of eight parts of teroxide of thallium and one part pentasulphide of antimony (commonly called the golden sulphur) has the property of igniting by friction. A mixture of teroxide of thallium and powdered sulphur ignites with a sharp explosion when struck. The pierate (?) of thallium may be exploded in the same manner. However, the scarcity of thallium will prevent any use of these compounds for commercial purposes.

A PROCESS FOR DEODORIZING PETROLEUM OIL.—That very industrious technical chemist, Dr. R. Wagner, tells us that the disagreeable odor of petroleum oil can be taken away by treating the oil with a solution of plumbate of soda. This is only a solution of oxide of lead in caustic soda, and will certainly remove all such odor as sulphur compounds might communicate to the oil. How far it may affect other smells we cannot tell without experiment.

IODIDE OF SILVER PHENOMENON.—Pizeau, in his researches on the dilation of minute crystals, found the chlorides, bromides and iodides following the same law of expansion by heat, with the exception of iodide of silver. The crystals of the latter salt actually contract instead of dilating by the application of heat.

THALLIUM IN COLORADO.—Mr. Z. W. Chase, while prospecting in Colorado during last year discovered, near Breckenridge, Summit county, a silver lode, bearing galena. He states that the vein is about six feet in width, and that an average sample of the ore, analyzed by Dr. Charles T. Jackson, contained a little over three per cent. of the metal thallium.

The velocity of the sound wave in air of the freezing temperature is 1,090 feet a second. The velocity of sound in air increases 1-6 feet for every degree centigrade of temperature.

From the Commercial Herald and Market Review.

MINING REVIEW FOR 1867.

Discovery of Gold in California.

The nineteenth day of the present month inaugurates the twentieth anniversary of the discovery of gold in California. This metal had previously been reported by the early adventurers on the coast as existing here in great abundance. One of the historians of that period, in his account of the visit of Sir Francis Drake to California, made more than three hundred years ago, declares that no part of the earth could be taken up that did not contain a reasonable quantity of gold; a statement, so far as any actual knowledge of the fact was concerned, belonging, no doubt, to that class of fictions so frequently indulged in by those who had visited strange and distant lands at that day. But, while those exaggerated tales were so manifestly inventions of the imagination, gold really did exist here in unexampled abundance; and there is little question but that the Catholic missionaries were cognizant of the fact, though from prudential motives preventing its attaining publicity as far as possible. Small quantities of gold dust were obtained by washing auriferous earth found at San Isidro, San Diego county, in 1828; a silver bearing lode having been discovered at Alisal, Monterey county, twenty-six years before. Further deposits of argentiferous ores have since been met with at this point, but they have thus far proved of too low a grade to warrant transportation elsewhere for reduction, there being no local facilities for the purpose. Traces of work performed long since on a rich gold and silver bearing ledge situated in San Gabriel Canyon, 22 miles northeast of Los Angeles, are yet visible, the Indians declaring that the Padres know of its existence, but prohibited them from working or speaking of it. In San Francisco Canyon, 45 miles northwest of Los Angeles, placer diggings were found as early as 1833, which continued to be worked steadily, when there was a sufficiency of water, for more than ten years; having been abandoned only on the discovery of the rich placers further north. Since that event, even, these early diggings have occasionally been worked on a limited scale, and with moderate success. The annual value of the gold taken out here prior to 1848 amounted to about \$6,000, making an aggregate collected up to that period of \$60,000. But not only had limited washings of the sand and gravel been carried on long prior to the American occupation of the country, but attempts had also been made at working auriferous quartz; a Frenchman named Barie having engaged in this business with arrastras, near the Mission of San Fernando, as early as 1843; from all which it becomes apparent that the finding of gold at Sutter's mill, on the 19th of January, 1848, while it was then and there met with in greater quantity than ever before, and the event led to the most important results, was not really the first time this metal had been found, and the business of collecting it been carried on within the limits of California. It is even pretended that our Government had some inkling of the great mineral wealth of this territory at the time the treaty for its purchase from Mexico was being negotiated, which instrument was ratified on our part only about a month after the discovery of gold at Sutter's mill, and, of course, before any intelligence of that event could have reached Washington. The probabilities, then, are that the United States authorities had no knowledge on the subject other than had been gained from the facts already narrated, and, perhaps, the opinions expressed by those who had been in California, that it bore the appearance of being an auriferous country. That the great placers should not, under the circumstances, have been discovered earlier, seems a little strange. For more than thirty years the hunters and trappers of the various fur companies had pursued their calling along the rivers that make down from the Sierra Nevada; exploring parties, accompanied by scientific attendants, equipped and sent out by the Government for the special purpose of ascertaining and reporting on the mineral and other natural wealth of the regions passed over, had traversed the country in every direction, crossing these same streams in innumerable points; and immigrant trains had slowly journeyed down them, camping time and again on the auriferous bars along their banks, while intelligent foreigners had for years resided in the country, and even published books descriptive of its natural resources, and yet no discovery had been made of these immense gold fields—very little having been ascertained, and less said, except in a casual and haphazard way, of the metalliferous wealth of California. The finding of these stores of ready created wealth, lying almost upon the surface of the ground, was reserved, like many other important discoveries, to be accomplished through the agency of obscure persons and by the merest accident.

Progress of Mining, New Inventions, etc.

During the year 1848 there were at no time more than five or six thousand men at work in the mines of California—throughout the first half of that year not a third of that number. The earnings of the miners were at that period very uneven; some who happened to strike rich spots and the few who employed Indian labor realizing large sums in a short time, while others, who were not so shrewd or fortunate, found it difficult to take out the traditional "ounce," which was even then considered a fair average day's earnings, being the price usually paid for hired labor. The value of all the gold dust extracted that year is estimated at \$10,000,000. During the next two years, the population having meantime largely increased, the product of dust was augmented at the rate of ten million dollars annually, and for the next succeeding three years at the rate of about three millions annually, it having reached its culminating point—\$65,000,000—in 1853. After this the annual yield of gold bullion, being exclusively the product of this State, gradually declined until 1866, when it had fallen to \$28,500,000—thus far the minimum reached, the product of 1867 being estimated at somewhat more; and there is little doubt the yield will henceforth undergo a steady and marked augmentation for several—perhaps for many years to come.

With the increase of gold dust the treasure shipments from the port of San Francisco increased, subsequent to 1849, in a corresponding ratio, though the annual product of the former continued to be in excess of the latter, in sums varying from two to fourteen millions, down to the year 1861, when the treasure exports began to exceed the yield of California proper, the receipts of bullion from Ore-

gon, Washington, British Columbia and other outside localities beginning then to tell on the annual shipments of treasure abroad. From 1861 to the present time the yearly exportation of bullion has undergone a steady increase, advancing from less than forty-one million dollars, the lowest point reached, to nearly forty-two millions, the amount estimated to have been sent away the past year. During the same period the total bullion product of the coast reaching San Francisco has advanced to a yearly sum of about sixty millions, being much greater than indicated by the shipments made; a circumstance arguing a greater retention of capital in the country and increased confidence in investments at home.

As stated, a rapid increase of population took place in California, commencing early in 1849 and continuing for several years, whereby individual earnings were speedily reduced, though the aggregate amount of dust taken out was largely augmented. Miners' wages, which here might fairly be considered the standard of earnings, and which ruled at \$16 a day in 1849, had fallen to less than half that sum in 1852, and to about one-quarter by 1859, at which figure, or a little less, they are still maintained throughout most mining sections of the State. At the present time \$3 in gold, exclusive of board, are the wages paid miners in the more southerly mining districts—\$3 50 in the central, and \$4 in those lying further to the north. At first the only implements used for obtaining the gold consisted of the shovel, pick, pan and rocker, the latter from its greater efficiency coming soon to supersede the use of the pan altogether. With these cheap and simple utensils the miner was for the first few years content, being able therewith to make good wages so long as the diggings were yet unworked and virgin. As the latter became impoverished, however, rendering it necessary for the miner to wash a much larger quantity of dirt, if he meant to keep good the old measure of wages, his ingenuity was tasked to devise new and more efficacious methods of operating. The first fruits of these inventive efforts consisted of the tom and sluice, accompanied with the puddling box, the latter being sometimes used for dissolving the dirt where it was found particularly hard or tenacious. Aided by these and other less noteworthy contrivances the standard of earnings was well maintained for several years longer, and until the river bars and gulches, the shallow flats, river beds, and, in fact, the greater portion of the more superficial and accessible diggings had become pretty well exhausted. At this stage further improvements in the instruments and process used again becoming imperative, the hydraulic mode of washing was introduced, and one which, though expensive and not everywhere practicable, is not likely soon to be superseded by any other. In addition to these, other agents and appliances were from time to time devised, both for facilitating the work of obtaining the auriferous earths from beneath the surface and for breaking down the high bank containing it and preparing it for more speedy washing. To this end pits were opened in the alluvial flats and basins, shafts were sunk and adits driven into the deep-seated gravel beds, and immense magazines of powder, placed in chambers excavated for the purpose, were exploded, shattering to fragments thousands of tons of earth, and thus rendering it easily broken down and washed away with currents of water. Under the demand thus created for additional supplies of this element a new impetus was given to ditch building, inaugurated some years before for taking water from the mountain lakes and streams and conducting it to points where required for washing. Simultaneous with the introduction of these more effective modes of operating, the ancient river channels, previously discovered at a few points, were traced for a long distance, showing them to extend in their ramifications over a broad scope of country, and to contain a vastly greater amount of wealth than had been found in the beds of the more modern streams.

Placer Mines and Operations—River Bed, Gulch, Bar and Beach Mining.

With the introduction of so many economizing agents and labor-saving appliances, and with so many new and broad avenues opening for future operations, placer mining has exhibited in all its departments marked signs of improvement during the past few years, giving ample promise that it will shortly more than regain its former importance and productiveness. This branch of mining is divided into two classes—deep and shallow, often resembling and to some extent running into each other. The latter, as the term denotes, is composed of such auriferous deposits as lie near the surface, generally not more than fifteen or twenty feet deep; the former of such as have been covered up by heavy bodies of alluvium or occupy the deep-seated channels of ancient rivers—the latter varying in depth from twenty to two hundred feet beneath the surface. To the class of shallow diggings belong such as are found on the present river bars and benches—in the beds of modern streams—along dry ravines—in shallow flats, etc. As distinguished from auriferous quartz and other vein mining, placer diggings, especially those carried on near the surface, are frequently termed *stream works*, because worked by means of open pits and washed with streams of water.

River-bed mining is carried on in the beds of such streams as fail to dry up during the summer, and is effected by damming the stream, usually at the head of a rapid, and turning it into a ditch or flume running along its bank, whereby the channel being left dry, the sand and gravel is removed and washed in sluices. Sometimes recourse is had to wing-damming, whereby the same end is partially obtained with much less expense and hazard than by attempts through dams and flumes to drain the entire bed of the river. Both methods are precarious, owing to the frequent occurrence of unexpected freshets; and, having often proved failures, even when spared these disasters, the business has of late years been pretty much abandoned by the whites and left to the Chinamen, who still carry it on quite extensively, being able with their more plodding and painstaking habits to make what to them proves satisfactory wages. This branch of mining was at one time largely engaged in, and though occasionally attended with enormous profits, more generally resulted in entire failure, the causes of which were numerous and unavoidable. Sometimes the miner, after having drained the river at heavy expense, was unable to get to the bed rock where lay the richest dirt, on account of too great seepage; sometimes the dirt when obtained proved too poor to reimburse a tithe of his outlay, while again, perhaps, an unreasonable rain in the mountains would bring down a flood, sweeping

away his works or filling up his claim before he had been able to realize anything from his labors. Moreover, this business, besides being extra hazardous, is, where damming and fluming is resorted to, attended with heavy expense; the lifting of a large river from its bed and conducting it through flumes for a mile or more costing in some cases several hundred thousand dollars.

The principal localities of this species of mining are now the Merced, Yuba, Feather, Scott and Klamath rivers and their tributaries, many sections of these, as well as almost the entire beds of other streams in the State, having been pretty well exhausted through repeated washings continued through a series of years. At all these places, except on the main Feather river, three-fourths of this work is now being done by Chinamen. On the Merced and a few other streams they are the only class engaged in it. The past season has proved moderately favorable for operations of this kind, there having been no disastrous freshets to impede work, and the rivers continuing low until a late period in the autumn. The high stage of water the present winter, however, has compelled a general suspension of the business, it sometimes happening that operations, if not stopped by the first heavy rains, are continued throughout the winter. Generally the large companies, apprehensive of a sudden rise of the river, remove their implements and give up work about the setting in of the wet season, resuming it again as early as practicable the next summer. Many of these claims are so extensive that it requires a number of years to work them out entirely, while others may be exhausted in a single season. Some of the richer and more extensive often yield as high as fifty or sixty, and even one hundred ounces per day—from forty to eighty dollars daily to the hand throughout the working season.

Gulch and River-Bar diggings, at first the principal branches of mining, have now become so far depleted as to count but little in the general estimates made of the business in California. Nevertheless they still give employment to considerable numbers, especially in the more northern counties, where both classes are far from being exhausted. To men of small means they also present a favorite field of mining in other parts of the State, many of this class re-working the river bars year after year, and resorting to the gulches and ravines during the winter, when the rain fall supplies water for washing with success, and when for a short time their earnings are often very fair. As intimated, the most prolific diggings of this kind are situated in the more northern counties of the State—Trinity, Klamath, Siskiyou and Del Norte; the more remote position, rugged surface and rigorous climate of this region, coupled with the long continued Indian hostilities, the greater expense of travel, cost of living, etc., having tended to discourage both capital and population from going into the country. The placers, originally as good as in almost any other part of the State, have been less extensively worked, and, as a consequence, are not impoverished to the same degree as elsewhere. There are yet considerable tracts of ground still virgin, or but partially worked, while the supply of water is much better than in the more southern counties. Besides a greater amount of precipitation, the snow lying on the higher mountains until late in the summer keeps the streams full nearly three-fourths of the year, rendering the period that the miner suffers for want of water comparatively brief. With these advantages this section of the State offers better inducements, perhaps, than any other, for such as desire to engage in placer mining without investing much money in the purchase or opening-up of claims. This new or but partially washed ground is found mostly on flats and ravines lying back from the main streams, though many of the river bars still afford good opportunities for earning fair wages. There still remains a broad scope of placers on the Hay Fork, South Fork and upper tributaries of the Trinity, as well as on the confluents and headwaters of Scott and Salmon rivers. The country here, though extremely mountainous and worth little for agricultural or grazing purposes, is well watered and abounds with the best of timber; the latter an important consideration where lumber may be required for fluming and other objects. There is also enough of arable and grass land, consisting of small alluvial flats, river bottoms and mountain meadows, to supply all local demands for grain, hay, fruits and vegetables; nearly everything of this description being grown here with as little trouble and in as great perfection as in almost any other of the mountain districts of the State. And although the snow falls to a great depth on the mountains, it never accumulates beyond eight or ten inches, and rarely ever lies for more than a few weeks in the valleys—never being seen near the coast, except at a distance. The whole of this region is accounted unusually healthy, the intermittent fevers so common in the more central counties being unknown here. With so many advantages, and so few drawbacks, this section offers better inducements to laboring men than any other part of California, and infinitely better than any of the adjacent States or Territories.

In Bar and Gulch diggings the past year throughout this region has been one of general success. Though operations were somewhat delayed by cold weather, and high water early in the season, the general yield has been above the average for several years past. The localities in which mining was most active and well rewarded were along the main Klamath, Trinity, Scott and Shasta rivers and their tributaries; the most of which, being fed by the drainage of the snowy mountains that cover the whole northwestern corner of the State, were kept at a high stage until the summer was well advanced. With the impoverishment of the auriferous earth, in order to make wages it becomes necessary to wash much larger quantities of dirt than formerly, to which end an additional amount of water is called for. When operations were carried on with the tom and rocker, a very small stream sufficed; but with the introduction of sluice, ground sluice and hydraulic modes of washing a much heavier body becomes indispensable; a circumstance that gives to this region one of its most marked advantages.

Another very effectual method of disposing of dirt is by ground sluicing, which is also here carried on to a large extent, the abundance of water rendering it feasible in numerous localities. Availing themselves of this condition of things, the miners, during the spring when the ravines were running full of water, disposed of an immense amount of dirt in this manner, thereby greatly facilitating summer operations, and adding largely to their aggregate earnings.

While in the northern tier of counties this class of surface diggings has been operated during the past year with more than ordinary success, it has not failed to prove moderately remunerative in other parts of the State. Shasta county, like its more northern neighbors, still presents a good field both for the laborer and the prospector, there being yet many unoccupied spots, where fair wages, with the chance of an additional "strike" can be made. At Muletown, Marion Flat, Pittsburg, Dutch and Barker Hills the great body of miners have the past season been well prospered, nearly

all the claims on Mad Ox and Mule Canyons have yielded an ounce a day to the hand, some of them double that amount—the gold generally being coarse, many of the pieces weighing several ounces. These diggings are said to pay nearly as well now as when they were first discovered, some sixteen years ago. At Janesville many claims have yielded from ten to fifteen dollars per day to the hand, after paying for water and all other expenses. After thorough trial it is found that a considerable stretch of elevated bars on Flat Creek can be worked with profit, if properly managed. At French Gulch many small companies have taken out as high as \$75 daily for weeks in succession. Some good diggings were discovered in the latter part of the summer on a small stream known as First Creek, near Pittsburg. The pay dirt, which is moderately rich, is easily reached, and has yielded to several companies working it a liberal reward.

Coming south from Shasta we enter the more early settled and populous region composed of the northeastern and central mining counties of the State, where this class of placer diggings is much more nearly exhausted than in the section just considered. Yet even here, when we view it as a whole, we find large numbers engaged washing over the old river bars during the dry season, or working in the shallow flats and gulches when the rains afford water. The former are now mostly given up to the Chinese, who, paying little or nothing for water, manage, by carefully washing over the immense heaps of tailings, to make what to them are satisfactory wages. Sometimes these people, by striking rich spots formerly passed over; by working further into the banks than was done by their predecessors; or by finding, as they often do in these old tailings, large nuggets of gold, not only realize working wages, but take out in a short time considerable fortunes. Their reticence, however, on this subject is such that it is no easy matter to estimate with anything like precision their average earnings. That they are larger than is popularly supposed seems probable; their motives to conceal and understate their earnings being, as is well known, very numerous.

Scattered among the hills and mountains throughout this belt of counties are many auriferous spots, to which water cannot be brought by means of ditches, or which, being isolated, are of too limited extent to warrant such expenditure, and are, therefore, worked at such time only as this element may be furnished by the rains and snows. As these supplies are often scant and of short continuance, these spots sometimes last for many years, so little work being done upon them each season. These localities, with the more extensive and, generally, much poorer flats and prairies, afford a field for winter operations to a large class of miners, who, when the water falls, usually return to the river beds and bars, or engage in the service of others on wages. To mention here even a tithe of the localities in this group of counties, where this particular kind of mining is carried on during the wet season would be impracticable, because of their number. A few of the more notable, on account of their extent or richness, may, however, be referred to.

Beginning with Plumas, the most northern of these counties, we find that the early and copious rains of the past fall and the present winter have everywhere filled the streams, and set the miners, who had been waiting for water in the dry ravines, to work sooner than usual. Never, in fact, was the supply over the whole country more abundant and, up to this time, well sustained than it has been the present winter; the rivers, ditches, ravines or reservoirs running full or overflowing, there being in many places an excess of water. Considerable damage has been sustained from this cause through the filling up of claims with mud and gravel and the washing away of sluices and other apparatus. At Mohawk Valley, Plumas county, quite an extent of placer diggings has lately been discovered, and a number of companies are now making good wages there, with the prospect of their ground holding out for a long time. Near Argentine some virgin ground has also been struck that promises well; while excellent prospects have been obtained in the same vicinity, on Squirrel Creek, the gold at all these places being coarse and lying near the surface. At Soda Creek and Cariboo, both in this county, superficial placers are being worked largely and profitably. The washing here is done chiefly with the tom and rocker, small parties working with these implements frequently taking out from thirty to sixty dollars per day.

South of Plumas, and extending all the way down to Kern county, lying at the southern extremity of the gold-bearing belt, surface placers are this season being worked with more than ordinary success, places where specially good wages are realized being numerous. In the vicinity of Gilsonville, Sawpit, Newark, Downieville, and at various other points in Sierra county, are small but lively camps of this kind, whereat the daily earnings vary from ten to twenty dollars to the hand during the working season. As we progress towards the south, these superficial diggings, requiring little preliminary outlay to open them, and easily operated by the miner's unskilled labor, diminish in magnitude and number. In Butte county are found remnants of them in many of the flats and ravines, and on a few of the bars along the Forks of Feather river. In Nevada they occur near Eureka, at an altitude much higher than it was at one time supposed placer mines of value were likely to exist. At Coyoteville surface earth is being worked with good results, while, but a short distance above the Allison Ranch, several acres of ground were discovered last year, which, on trial it is found, will pay remunerative wages. At Colfax, Placer county, a scope of ground, previously but little worked, was not long since opened, and has given satisfactory employment to a number of hands at sluice washing. About Greenwood Valley, on the gravelly prairies, and in the numerous depressions that exist among the lower foothills of Eldorado county, throughout a considerable scope of country around Folsom, Sacramento county, and at several points in Amador, Calaveras and Tuolumne counties, are many surface claims that are now yielding fair average wages. In Mariposa county, where much of the gold has always been found in streaks and pockets, the late copious rains have laid bare many spots heretofore buried up or overlooked, and furnished water in many dry gulches not supplied in ordinary seasons.

Thus we find that this portion of the placer mines, while they contribute but little towards the aggregate gold product of the State, are still a source of considerable revenue, and give profitable employment each succeeding year to large numbers who have not the means to engage in other more expensive and permanent styles of mining.

New Discoveries.

Both in the shallow and deep placers, notwithstanding the rapid exhaustion of the former, are of frequent occurrence in California; the following being among the more important made during the year just closed: On Dog Creek, Shasta county, a number of claims located in the summer, on newly discovered ground, and also others on First Creek, near by, have since opened up well. Similar ground taken up at Galloway's Ranch, and also some gravel deposits found near Milltown, both in Sierra county, are likely to prove of considerable value. The discovery of placers is announced as having been made in Mendocino county, but whether of sufficient richness to warrant their being worked has not

yet been determined. A belt of country, some fifteen miles long and eight or nine wide, extending from Chilli Camp in Calaveras county southwest through Camanche and Frankford down to the edge of the great San Joaquin valley, and which, previously known to contain gold, having been more thoroughly inspected last summer, turned out to be extremely rich in many places; nearly all the ravines, and even the summits and sides of the hills holding a sufficiency of the precious metal to pay well for washing where water is abundant. Encouraged by the prospect of utilizing so broad a scope of diggings, their almost wholly without water, the Mokelumne and Campo Seco Canal Company at once commenced the work of extending their ditch through this region, the completion of which has rendered the latter one of the most active and prosperous districts in the State. At various points throughout the counties extending south from Calaveras to Kern placer diggings, in some instances quite rich, but of no great extent, have been discovered during the past year. On Lytle creek, San Bernardino county, a great breadth of gold-bearing earth has been met with, much of which, if water were brought upon it in sufficient quantity for ground sluicing, might be made largely tributary to the industry at that section. With the present limited facilities the claims here are paying day wages, varying from five to fifteen dollars. A ditch has been projected for bringing water to the diggings. In Holcomb and El Tehachita valleys, in this county, a limited extent of fairly paying placer mines exists. At a point seventeen miles above Fort Yuma, in San Diego county, a company of miners attempted to sink a shaft, more than a year ago, with a view to reaching a rich deposit of gold dust supposed to exist at that place. Owing to the rapid accumulation of water in their shaft they were obliged to procure a steam engine for pumping it out. The machine obtained, however, proving insufficient for the purpose, the company were finally obliged to abandon their claim without realizing anything for their labor and outlay, or being able to fully assure themselves of its actual value. Not only do new and important discoveries continue to be made every year in this department of placer mining, but those instances of rare success, commonly denominated

Big Strikes.

Which so dazzled the popular imagination in the early days, still occur, though doubtless of less magnitude and at longer intervals than formerly. Scarcely a day passes without incidents of this kind being recorded by the local press in some part of the mining districts; while it must be remembered that many of these cases happen without gaining publicity, there being valid reasons why certain classes should seek to conceal them. Selecting at random a few pertinent cases of this kind from the many that might be mentioned, we find that three lumps of nearly pure gold were picked up at You Bet, in August last, the united weight of which was \$39,000, valued at ten thousand dollars. In February a nugget of pure gold weighing nearly four pounds, was found in Mariposa county; chips varying from ten to twenty ounces being common in that section. In May, parties ground sluicing on French Ravine, Plumas county, washed out a slug weighing fifty-seven ounces, worth about \$1,000. A Frenchman who had sold his claim in Last Chance, Butte county, with the privilege of working it a day or two longer took out during this time a fifty ounce nugget, also worth nearly \$1,000. A gang of Chinamen working in the vicinity of Kanaka Flat, took out in the month of July, a piece of gold weighing forty-five pounds, worth over \$15,000. The strike was concealed until after the parties making it had taken their departure for China. The week following another company of these people picked up near the same place a chip weighing forty-one pounds. In September, a thousand dollar lump was washed out on Dog Creek, Shasta county, and about the same time, a Mexican, working at Hornitos, Mariposa county, struck a pocket from which he extracted over \$3,000 in the course of a few hours. In the same county a Chinaman scraping over some old diggings, found a nugget worth five hundred dollars. In November, a man named Rohards, who had long been mining with but indifferent success, came upon a fissure while working in Placer county, from which he took out over \$3,000 coarse dust in three days. In the same month, a thirty ounce piece was picked up at Colorado, Mariposa county; all of which, without further multiplying examples, serves to show that these lucky strikes, though exceptional, are sufficiently common to keep the miner's hopes in a state of tension, and thus sustain him, as often happens, through years of deprivation and fruitless endeavor; for it must not be forgotten that, while the number of these cases of marked success seems so very considerable, they go but a small way towards establishing a high average of earnings for the great body of miners.

Passing from these limited and comparatively speaking, nearly exhausted surface deposits, we come next to consider

The Deep Placers.

Which, occupying the channels of ancient rivers, now present the most prolific and extensive field for pursuing this branch of mining to be found in California. This system of former rivers extends over a large portion of the central and northeastern mining counties, having been distinctly traced from Tuolumne to Plumas, the main channel ramifying into several branches, as it is followed towards the north. The body of auriferous gravel, in some places so indurated as to be termed cement, varies in thickness from a few feet to several hundred, and in width from two hundred to a thousand or more, attaining its greatest breadth at points where these streams appear once to have widened out into lake-like expansions. As a general thing, where richest they do not average more than thirty or forty feet in width, and six or eight in depth or thickness. In some spots they are fully exposed, having been cut by the corrodent action of the streams that now cross them nearly at right angles, while at others they are buried over two hundred feet beneath the surface. The gold in these channels was collected at the time that large streams were coursing through them, by the same agencies, no doubt, that are operating to enrich the beds of modern rivers. Afterwards these channels were filled up by a flow of lava, portions of which having hardened into basalt, produced the columnar table mountains seen standing over sections of these old rivers at the present day; the greater portion of these basaltic formations having been disintegrated by the action of the elements, and scattered over the adjacent country. It is now over thirteen years since the work of exploring these channels first commenced, every year furnishing additional evidence of their extent and richness. As frequently happens in discoveries of this kind, the first knowledge gained of them was through accident, or was at least gained while the discoverers were in pursuit of another object. From small beginnings entered upon by a couple of miners, this department of mining has spread far and wide, until, without having yet reached its limit, it occupies a most prominent place in placer operations. Commencing in Tuolumne county and traveling north into Plumas, we find at intervals, and in some places for consecutive miles, throughout this entire belt of country, the work of developing these ancient river beds going on. Until we arrive as far north as Placer, operations are being conducted on a comparatively limited scale; but at Forest Hill, in

this county, they suddenly expand into magnificent proportions, this being the site of many of the most valuable claims yet opened along the line of this subterranean gold field. The work of exploiting these

Ancient River Beds.

Is effected mainly through shafts, open cuts and bed rock tunnels, the construction of which, in many cases, requires several years, and involves the expenditure of large sums of money—not a few of the latter having cost fifty to two hundred thousand dollars. As it becomes necessary, in order to the removal of the entire mass of this cement and gravel, that these tunnels be run on a level exactly striking the lowest point of their containing basin, with sufficient fall for drainage, the exercise of much engineering skill is requisite to their proper location. Generally these tunnels are of large dimensions—eight or nine feet high and from six to ten feet wide—being intended for the accommodation of a double tramway or railroad track, by which two sets of cars can be run out and in at the same time. In some instances the shafts sunk are vertical and in others inclined, drifts or tunnels being run from the bottom. Open cuts are resorted to only where the superincumbent mass is of no great thickness. In removing this gravel it is customary to divide it up into sections by means of drifts, after which it is breasted out according to the manner usually adopted in coal mines. If sufficiently soft and loose to readily release the gold by the action of water it is washed in sluices; when too hard and adhesive for this purpose, it is treated like vein ore, being crushed with stamps in what are known as "cement" mills, many of which have lately been erected for the treatment of this material. The gold yield of this gravel is sometimes enormous, thousands of dollars' worth often being extracted from a few cubic yards. So very rich has it been found in certain localities that each individual was restricted by the mining laws of the place from holding more than an area fourtenth of a square, from which limited space very handsome fortunes were frequently taken out.

Taking a few cases of average and of extreme success with others of total or partial failure, in this branch of mining, as we find them reported during the past year, they run something as follows: The Hildreth claim, at You Bet, Nevada county, working eighteen hands, netted the owner over one thousand dollars weekly—the entire amount of capital invested in erecting mill, opening claim, etc., being \$25,000. From the contiguous ground of Noree & West, \$50,000 was taken out in ninety days, after which the yield ran down quite low, while the cement of two other companies near by for a time at least, barely paid for working. The Union claim at Howland Flat, Sierra county, employing seventy-five men, took out, during the summer, four hundred car loads of dirt daily, which paid at the rate of one dollar to the load, the cost of removing and washing being sixty cents. The stratum of gravel here varies in thickness from two and a half to seven feet, and is reached through a tunnel three thousand feet long run from the bottom of a three hundred and sixty foot incline. The opening of this ground has been expensive, but the large mass of pay dirt will insure profitable working for a long time to come. A claim opened in July at Douglas Flat, Calaveras county, on the so-called "Blue Lead," being supposed to occupy one of these ancient river channels, yielded at the rate of twenty-five cents to the pan; while, as the pay earth seemed abundant, also pointed to profitable workings in the future. In the same month and county, a streak of gravel was reached in ground being opened at Chilli Gulch, some of which paid over fifty cents to the pan. At Dutch Flat, Placer county, Williams & Mallory struck the "Blue Lead," in the month of July, and with six days thereafter, took out \$13,000. Nearly all the claims thoroughly developed and judiciously worked at Forest Hill, in the same county, have been steadily yielding large revenues to the owners throughout the year; while others near by, equally well managed, have failed to pay current expenses, or, at most, ordinary wages. The causes of these failures, however, are apt to proceed from mistakes made in locating the exploratory works, or estimates of cost, or similar errors, rather than from the actual poverty of the mines themselves.

Differing in volume, geognostic position, and modes of occurrence from these rich gravel ranges, are the extensive beds of alluvium and drift that supply over so large an area of the mining region the material for

Hydraulic Washing.

A mode introduced about fourteen years ago, and by which the weight and momentum of the water, acting under a high head, is made to do the work of propelling and washing the auriferous earth, and of carrying away the tailings at one and the same time. The apparatus at first employed for conducting and discharging the water, a simple hose and nozzle of small dimensions, has since been modified and enlarged that but little of the original can be recognized in the appliances now in use, though the principle remains the same. As stated, the material chiefly operated upon by this style of washing, consists of immense masses of mixed alluvium, gravel and drift, forming in some places high banks, extended flats or rounded hills, the product of dynamic movements, glacial and volcanic action, and other disturbing causes operating long prior to the formation of the present river system. In some localities the auriferous masses are spread over thousands of acres, and have a thickness varying from a few feet to two hundred and fifty or more; their average thickness being at least one hundred and twenty feet. They everywhere rest on a stony basis, designated the "bed rock," and are in many places capped by a heavy stratum of volcanic matter, which, at one time, no doubt, covered them entirely. Where this capping has been worn away, exposing them to the action of the elements, these gravel deposits, through disintegration, have been broken down and scattered, thereby materially diminishing their former thickness, which is much greater where this protection still remains than elsewhere. Scattered through all parts of these gravel beds are particles of gold, though they generally increase in richness as the "bed rock" is approached. Owing to this fact, as well as the necessity that exists for getting rid of the upper and poorer portions, it is usual in practice to wash the entire bulk away. In many cases the "bed rock" underlying these accumulations of gravel being basin-shaped, it becomes necessary to cut a channel—usually denominated a bed rock tunnel—through its rim, to drain off the water, which otherwise would prevent the miner securing the richest stratum of dirt, generally lying, as already observed, near the bottom. This tunnel does not aim to strike, as in the case of the ancient river channels, the exact bottom of the auriferous gravel, but is generally run on a level from fifty to a hundred feet below it, a shaft being afterwards made to connect the tunnel with the gravel above. Through this shaft all the rocks and dirt, together with the water used in washing, is made to pass, the whole by the momentum gained in its descent tending greatly to grind up the earth and set free the gold. Along this tunnel are laid the sluices, two usually being put down, that one may still be used while the other is being cleaned up. In many claims no "bed rock" tunnel is required, there being no basin to drain, or rocky rim to cut through. In these cases the sluices are set and the entire operations conducted above ground.

In some instances, where these gravel banks are found, as often happens late in the summer, to be particularly hard and dry, or are composed of more obdurate material than ordinary, blasting with gunpowder is resorted to as a means of facilitating its being broken down with the pick and preparing it for the more ready action of water. To this end a drift is run into the bank, at a low point, for a hundred feet or more. At the extremity of this, chambers are excavated on each side, into which the powder, amounting often to 200 kegs or more, is placed and by means of a fuse exploded, resulting in the shattering of many hundred tons of earth, which can then be piled down and run off without much trouble. Without attempting to enumerate the various localities where this method of washing is employed, or to convey an adequate idea of its importance, it may be stated that it is everywhere in use along the entire gold belt, being most common in the counties lying between El Dorado and Plumas; and that millions of cubic yards of earth are now annually washed with profit, that would otherwise, most likely, have remained untouched. To say that it has been the means of adding every year since it became largely employed, twenty per cent. to the hullion product of the State, would hardly be placing its claims as an efficient auxiliary in too strong a light.

Beginning on the south, the farthest point in that direction where this mode of washing has been resorted to is Tehachapi valley, Kern county, where it is used to advantage so long as a sufficiency of water can be had. From this point north to Forest Hill, Placer county, it is employed at many points with the usual good results. As the deposits at this place consist mostly of cement, requiring mills for crushing it, the hydraulic washings are not extensive immediately about the town, though there are many conducted in the vicinity, each employing a small force and cleaning up, after a ten days' run, from one to two thousand dollars, over half of which are profits. At Little York, You Bet, and other points in Nevada county, companies employing more hands—generally from twenty to forty, and working double shifts, clean up from one to three hundred dollars daily above current expenses. At Gold Run there are forty or fifty rich paying claims, when water is plenty. The depth of earth washed here varies from 130 to 175 feet, beneath which is a conglomerate impregnated with gold, but so hard that it will require to be worked with stamps in order to get out the metal. Each claim works eight or ten men, at \$3 per day; consumes from 300 to 400 inches of water, and, when running, takes out about \$5,000 every fifteen days, a few of them at times doing considerably better. Of several companies working at Hildreth Hill, Nevada county, the Independent has such an extent of ground that it would require a century to exhaust it, working off a hundred feet of its face every day. The Eagle, near by, employ twelve men, use 400 inches of water, and three pipes, under a pressure of 225 feet. The North Star, employing the same number of men, and using 360 inches of water, make free use of powder for breaking out their ground. These, with three or four other smaller companies at this place, employing in the aggregate about eighty hands, perform with this force, and the aid of powder, more work than two thousand men could accomplish without this assistance and the use of the hydraulic hose. At Oro Fino, Siskiyou county, the hydraulic companies sluice off immense masses of top dirt in the winter, when water is plenty, rendering the task of finishing up much easier, when, later in the season, the supply is reduced. The same thing is practiced in other places where the winter affords a superabundance of water.

The foregoing cases are mentioned, not as furnishing examples of eminent success in hydraulic washing, but as indicating pretty nearly the average results of these operations. Much heavier yields with proportionably larger net earnings are obtained by many other hydraulic companies in the State. The celebrated Blue Gravel claim, and others, in the vicinity of Snareville, for example, divide enormous profits, the former being considered one of the most largely productive and profitable mining properties in the State. Occasionally undertakings in this class of mines prove entire failures, the gravel turning out to be of less quantity, poorer or more difficult to work, than was expected. Numerous cases might be cited of this kind, though it must be conceded that, taken as a whole, hydraulic mining has thus far proved one of the most lucrative and certain branches of the business. Besides the foregoing, which embrace the principal branches of placer mining, and the modes of operating therein, there are certain other subordinate classes, each worked by methods and apparatus peculiar to itself. Thus we have a description of placers denominated

Beach Mines.

The locality of which is on the ocean beach in the northwestern corner of California and in the southwestern part of Oregon. Commencing near Trinidad Bay, they are found extending along the coast at intervals of from five to thirty miles, over a longitudinal space of nearly 150 miles. The stretch of auriferous beach at Trinidad, a little over one mile long, is owned and worked with success by Dr. John A. Veatch. The next beach, twelve miles north, is owned by one Jans, who for several years has worked it with good results. It is about four miles in length and is called the Lower Bluff, being a few miles below or south of the original Gold Bluff, the discovery of which in the spring of 1851 first turned public attention to the subject of these gold bluffs and beaches, it having at the time given rise to much excitement, and led to no little speculation. The upper beach, at the foot of the original Gold Bluff, is now owned and worked by General Wilson and associates, this gentleman having been one of the first to engage in the business. They claim several miles of beach and have taken out a great deal of money. North of this point, for more than a hundred miles, patches of auriferous beach occur at intervals, the whole of which are claimed and to some extent worked, though neither here nor elsewhere along the coast do any of these beaches yield a tithe of what they might be made to produce, owing to the extraordinary manner in which the most of them are monopolized. In length they vary from two to twelve miles, and yet the longest of them are sometimes held by a single company, or by two or three companies at most, who give employment to perhaps a couple of hundred men, the most of them on wages, whereas with what might be considered a reasonable distribution of these properties thousands of men might be profitably engaged.

Position and Formation of the Gold Bluffs and Beaches.

Wherever there is a gold bluff along this portion of the northern coast, there is an auriferous beach adjacent to it, the latter being formed through the washing away of the former by the action of the waves. These bluffs are high, sandy ridges running out into the sea, and are thought to have been originally formed by the same agent that is now wearing them away. The gold they contain was, no doubt, in the first place washed down by the Klamath, Rogue, and other auriferous streams that discharge into the ocean along this part of the coast; it having afterward, together with the sand, shingle and other material of which these ridges are composed, been thrown up by some convulsion of nature, or possibly by certain currents in the sea, which do not now

exist. Imbedded in these bluffs are large trees, ferns and other plants of the same species now found growing to the country adjacent, indicating that they were formed in part from the flood wood and other matter that had drifted from the land, and, in all probability, at no very remote period in the past. In some spots the material of which these ridges are composed has hardened into sandstone, though in most places they are of a loose, granular structure, easily affected by the action of the surf, which, sometimes breaking upon them with great force, readily explains how they come to be worn away and carried out to sea, the currents that here at regular seasons set up and down the coast, tending to scatter them widely on either hand. That the gold contained in the beach sand is derived directly from the bluffs is apparent, not only from the similarity between the dust in both cases, but from the further fact that the sea-shore between these beaches is barren of gold.

Modes of Prospecting, Gathering and Washing the Auriferous Sand.

The best time for prospecting and collecting the auriferous sand is at low tide, immediately after a gale or heavy storm, when the surf is apt to bring up new deposits and throw them high up on the beach. At such times it is customary for the foreman of the company to ride along the shore and ascertain where the richest places are; which being done, he at once hurries his whole force to the spot and secures as much as possible before the rising of the tide puts a stop to their labors. Though it requires a practical eye to readily pick out the most eligible spots for operating, anyone—even the most inexperienced—can, as a general thing, detect the glittering sand reposing in the edge of the black sand, as he rides along the beach. Where the gold is not thus apparent, the sand can be very readily and quite efficiently prospected by picking up a handful of it when wet, and, dropping it, observing how many small particles of dust adhere to the hand. When a favorable spot is found, the working force, consisting of from ten to twenty hands, is turned out, even if it be in the middle of the night, and every exertion is made to collect as much as possible; since, not only are their labors apt to be cut short by the incoming tide, but so feeble are these deposits that they may disappear, perhaps, before the next day, being swept away by another storm, or even carried by the tide itself beyond the miner's reach. The sand when collected is packed on animals beyond the reach of high water, and there deposited, to be afterwards carried to a suitable place for washing, sometimes a distance of several miles, if there are no streams affording sufficient water for the purpose nearer at hand. The washing is mostly done by sluices and is easily effected, as the particles of gold lie loose in the sand. In some cases it is performed at the time of collecting it, while in others this operation is deferred till summer, when, there being fewer storms to throw up the golden sand, there is less done in the way of gathering it; leaving more leisure for washing, and at which season, also, the working force of the companies is generally put to cultivating the land. In some instances five or six hundred tons of sand is thus accumulated and reserved for subsequent washing. The earnings of these companies, as well as of individual owners—a single person sometimes holding miles of the beach—are, as a general thing, quite large; the daily yield of the washings varying from \$50 to \$200 to the hand—the wages paid employees being from \$8 to \$15 per day and keep. That with such revenues these are valuable properties may be inferred when it is recollected that these deposits are inexhaustible, those worked the longest—over sixteen years—showing no appreciable impoverishment.

Tail Washings.

Consist of washing over, as is often done many times, the earth, sand, gravel, and other refuse matter left from former washings, which frequently accumulates in immense quantities, often so great as to interfere seriously with the labors of the miner, and cover up valuable ground, preventing its being worked altogether. Occasionally large portions of these tailings will be carried away by a flood, thus relieving the miner from their interference, and otherwise proving beneficial, since their removal often exposes valuable ground which otherwise could not have been reached except at considerable expense. In many cases this class of operations is found to pay well; these tailings, after laying for a year or two exposed to the action of the elements, becoming slightly decomposed, and thus releasing the gold from the clay and other tenacious substances in which it was imbedded. Coarse pieces of gold are also frequently picked up that have escaped former washings with the tailings. This business, though mostly carried on by Chinamen, is in many places still retained in the hands of the whites, who sometimes engage in it very extensively.

Ground Sluicing.

Is a process by which, when there is a large mass of top earth too poor to justify washing it, is disposed of by means of a strong current of water, which carries it away leaving the lower and richer stratum of earth to be afterwards passed through the sluice, which, in its reduced form, is readily done. This latter branch of the business is often left to be performed in the summer, when the miner has more leisure and water is less plentiful. The past two years, owing to the abundant supply of water, having been extremely favorable for ground sluicing, it has been extensively employed, and in many places to very good purpose. The Bush Creek diggings, in Nevada county, located in 1851, over one mile in length, are worked entirely by ground sluicing, and are said to have yielded to the parties who have owned them, at various times since, over three million dollars. Other claims in the same vicinity have also been worked for a long period and yielded largely. At Nelson Point and Argentine, Plumas county, this mode of washing has also been extensively practiced, and with variable results; some claims having failed to pay expenses, while others have realized moderate returns, and quite a good many enriched the owners. Among the medium class claims here, the daily yield ranges from six to ten dollars to the hand; that of the more prolific from twenty to thirty dollars. In Siskiyou, and other of the more northern counties, ground sluicing, owing to more copious supplies of water, is in greater use than elsewhere. The present winter having been more favorable than usual for operations of this kind, not only on account of the heavy rains, but also the mildness of the weather preventing the freezing of the water, a large amount of this preliminary labor will be performed, greatly facilitating the work of washing up next summer.

Quartz Mining in California.

This branch of mining, if not altogether prosperous and flourishing in every locality, is undoubtedly in a generally healthy and progressive condition throughout the State. Beginning on the south, we find the several mills erected in San Bernardino county, some of them quite recently, are mostly doing moderately well, though the same difficulties have been encountered here as elsewhere in the treatment of the sulphureted ores. There are now four quartz mills in this county, carrying 20 stamps, besides a large-sized Howell crusher, the whole erected at a cost of about \$10,000. In addition to these, there are a number of arrastras in operation. In San Jacinto valley, San Diego county, fifty miles southeast of San Bernardino, quartz lodes of favorable appearance are reported to have been found lately, though as yet not much is known as to their actual value, no work having been done upon them. (The review of the Coal, Copper, Borax, Petroleum and Quicksilver operations will appear next week.)

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, Dec. 21st: Work is carried on steadily upon the I. X. L. lode, and although the No. 1 ore, for which the company gets \$100 per ton at the dump, is not found in sufficient quantities to furnish even a small mill, yet they get some all the time; and of the second quality ore they find satisfactory quantities.

Work will be commenced on the Diamond lode next week. A shaft will be sunk and the mine thoroughly tested. The point selected for the shaft is beside the large croppings near the west wall of the lode, and the ledge matter close to the surface shows unmistakable signs of ore-bearing. The recent downward movement in the Tarshish, showing, as it does, that depth gives increased richness, leads parties who have claims upon either extension, to a knowledge of the proper way of opening them.

The workmen in the Tarshish mine yesterday brought in a lot of ore better than ever before found in the mine. The whole face is now looking finely, and so much ore has been run out during the week that the dump is entirely filled, and the superintendent goes out to-morrow to make arrangements for storage of the pay ore.

Mr. Graff, of the Tarshish mine, who is working the ores in person at Davidson's mill, has accumulated a huge pile of hullion, crude hullion and amalgam, and will probably finish the lot of ore now at the mill the coming week.

Amador County.

Ledger, Jan. 4th: A portion of the machinery of the Butte Basin Co. broke down last week, causing a suspension of operations for two or three weeks, as the repairs have to be made in Stockton.

Mr. Jno. Agrell, superintendent of the chlorination works of Messrs. Coney & Bigelow, has finished the working of a lot of sulphurets taken from the Keystone mine at Amador City, and the yield far exceeds the most sanguine expectations of the owners of that mine. The quantity of sulphurets worked was 16 tons, which produced 231 ozs. of gold—fineness, 971; value, \$4,639; average per ton, \$289.94.

Calaveras County.

San Andreas Register, Jan. 4: Late reports from Washington district have thrown the mining community into a terrible state of excitement. On last Monday we learned that the discoveries in that district were astonishing every one who had any knowledge of quartz mining in the vicinity, and that the extent of the rich quartz ledge region was marvelous. We also learned, from the most reliable source, that the Washington claim had just realized from 13 tons of rock, crushed from their quartz lode, the sum of \$900. A. T. Smith & Co. have a lead of the most wonderful richness—experienced and reliable miners declaring that the rock taken from their vein will average not less than \$500 per ton. Other claims in the same vicinity are reported very rich. An immense number of claims have been recently located, and, in spite of "wind and weather," the lucky locators are prospecting with a cheerful and hopeful industry, truly Californian. Capt. Ferguson has stopped work upon his claim, for the reason that he had made no preparations for residing at the mine during the winter. He was in our *sanctum* on Tuesday, and assured us that almost any of the veins upon which work of any importance had been done would pay \$70 to \$80 per ton.

A letter just received from Judge Coulter fully corroborates the above, excepting that the 13 tons worked by the "Washington" yielded only \$882. He concludes his letter thus: "New discoveries are being made daily. One thing I feel sure of, we have got it."

We are also reliably informed that some rich quartz rock has been discovered in the immediate vicinity of our town. Our miners appear more confident and cheerful than they have for years.

In speaking of the excitement the editor says: "Only about six months ago some quartz prospectors found their lead by washing the surface up to it, and several men set to and washed the ground on the lower side of the lead, where good quartz was found. The whole of the ground they washed paid good wages. The same lead has been traced for miles, yet not a particle of surface mining has been done by the side of it."

The *Mountain News* says that in the new mines at Frankfurt and vicinity there are from 50 to 75 companies at work, and that the mines are yielding from \$2.50 to \$10

per day to the man, clear of water. Notwithstanding the rainy weather, miners continue to flock to the new diggings, and are locating on claims and preparing them for work as fast as they arrive.

Mariposa County.

Mail, Dec. 28th: The late storm wrought more damage throughout the country than will probably ever be known in detail. We are informed that at Hite's Cove, Mr. Hite's mill, anstras, houses, suspension bridge, and everything, were swept away. We have heard Mr. Hite's loss, including a large amount of rich tailings, estimated at from \$50,000 to \$75,000.

Nevada County.

Transcript, Jan. 1st: The South Yuba Canal Co's ditch was badly damaged by the late storm. Also, the Bear Valley Ditch. Over 30 boxes were destroyed in Merrow's district. The Dutch Flat Ditch was broken in seven places and filled with slides, one of which is 500 ft. across. This part of the ditch will require 45 boxes to repair it. The damage is estimated at double the amount resulting from the floods of 1862. It is thought that it will require 40,000 ft. of lumber, at least, to repair the ditches, and a large force will have to be employed.

Jan. 3d: The claims of Ashburn & Co., on Scott's Flat, sustained more damage during the storm of last week than our item stated. We learn that all their iron pipe, several hundred feet, was so badly damaged by a heavy cave as to render it worthless. A large log, about 50 ft. long, was carried down by the immense quantity of earth into the flume, and in its course made a complete wreck of it. The distributor lies buried beneath many feet of dirt, stumps, roots, pipe clay, etc., and the framework was found lying on the bank of Deer Creek, about a mile below. It will take a month or two to repair damages.

Gazette, Jan. 4th: The heavy and almost uninterrupted rains of the past two weeks have almost put a period to all placer mining operations for the time being. Miners in most places have been busy in securing their claims against damage by floods or caving of the ground, and anticipate a golden harvest from an abundance of water next summer. The quartz mines have sustained very little damage by the storms, and operations generally have been but little interrupted. We have not heard of a single mine being flooded, though in two or three the workmen have been driven from the lower drifts by the rush of water, but the work in every case was continued in the levels above.

The Black & Young mill, near Eureka, has been constantly employed for the last three months in crushing rock from their mine. The heavy storms of snow and rain have not impeded operations to any extent. They have 20 men at work steadily in their mill and mine. Their rock pays handsomely, but the precise figures that the clean-ups show we are not at liberty to state. As they have an abundance of wood on hand at the mill, and plenty of paying rock in their mine, which is easily taken out, they expect to be able to keep their stamps going all through the winter, regardless of rain or snow. The mill averages over 20 tons of rock per day.

The North Star Co., at Grass Valley, have declared a dividend of \$10,000 to the shareholders.

The Grass Valley *National* says that the specimen hunters were early on the ground after the rain, and we hear of two of them being in luck. Gus. Upton picked up a piece of float quartz on Pike Flat, with from \$60 to \$70 worth of gold imbedded in it, and another hunter found a piece of quartz apparently filled with fine gold.

Grass Valley *Union*, Jan. 4th: Mr. C. W. Scott recently exhibited to us some of the rock taken out of the tunnel now being run in the Scandinavian mine. The rock is literally specked with fine gold, besides containing rich sulphurets. The ledge is now about three feet thick, and the new tunnel opens up an immense lot of ground. Early in the spring the company intend erecting a 10-stamp mill, negotiations for which are now going on.

Plumas County.

Quincy Union, Dec. 21st: Mr. Carr has found coarse gold in his claims on Mill Creek, between Rich Bar and Fales' Hill. Some of the pieces weigh as high as an ounce.

Shasta County.

Courier, Dec. 21st: When Jollia & Dosh were running their mill at Miletown, last fall, a number of persons affirmed that they lost the greater portion of the gold under the battery. The rock failing to pay, they concluded to tear up the battery and see how much gold had escaped. On making a thorough clean up, they found \$8, which satisfied them that their gold had escaped in some other manner.

Reports from South Fork are to the effect that nothing is going on there at present, and but little prospect of business improving for some time to come. Nearly everybody has left the mines, and the few who remain have gone into winter quarters, with the intention of waiting until spring for something advantageous to turn up.

Sierra County.

Downieville Messenger, Dec. 28th: The following is a list of the mining casualties in this county, caused by the late storm, so far as heard from. Several hundred feet of Clement's large flume, used for floating logs to the mill, have been carried away, together with some of the flumes of Rhodes & Larrien. The diggings of the last named parties were also filled with water. On the North and Middle Forks the result has been the same. Five hundred feet of the Good-year Bar flume was washed away together with the flume bridge across the river below Snake Bar; only one pier was left. Craig's bridge and all his fluming were also demolished and his diggings filled up. At the second rise of the Yuba, two or three hundred additional feet of Clement's flume was also washed away. The bridge which carried the Montpelier flume across the North Fork, was swept away by the recent high water. What the amount of damage is we do not know.

Jan. 4th: A person at Rock Creek recently went down the stream to prospect a bank of gravel which he had discovered. In digging a hole to collect some water for prospecting, he struck a deposit of gravel, and in the first pan he took out a specimen worth \$60. The discovery created considerable excitement, and claims were rapidly staked out in that vicinity.

During the storm, the flumes of the Reis mill were blown down and the ditches broken.

The St. Louis correspondent writes: The damage to ditches and flumes in this vicinity is very great. At Howland Flat the Union Co's timber shed was blown down, inflicting damage to the amount of \$500. The water rose in the incline of the Union Co., so that all work was stopped for several days.

At Grass Flat the track of the Pioneer Co. was broken by fallen trees, and afterwards washed away. The damage was more than counterbalanced by the washing away of several years accumulation of bedrock.

The Greenwood Co. at Greenwood, near St. Louis, had their incline filled with water, so that it ran out of the main tunnel.

Yuba County.

Marysville Appeal, Jan. 3d: The Pactolas Gold Mining and Water Co. of Smartsville, filed their Certificate of Incorporation in the office of the County Clerk yesterday. The object of the company is to carry on the business of mining on the extensive mining claims of James O'Brien near Smartsville, and the introduction of a further supply of water for the mines of Smartsville, Timbuctoo and vicinity.

We learn that the Jefferson mine at Brown's Valley suffered a little damage by water in the shaft. We also learn that the mine was cleared yesterday, when it commenced to crush its own quartz again.

ALASKA.

The American steamship *Constantine*, from Sitka, Dec. 28th, brings the following: Reports daily reach New Archangel of a gold discovery on the mainland, and the men employed in the Quartermaster's Department have given notice of an intention to quit the service in the spring and go to gold hunting.

COLORADO.

Central City Register, Dec. 17th: Some 60 or 70 tons of ore from the Baker mine have been in Martine's mill several weeks, and about 20 tons were worked recently, the bullion containing so much copper, that it required to be refined, time for which has not yet been found. Martine says it works easily and closely, and yields about \$75 per ton. The Baker mill building is completed, the engines and boilers set, foundations for three cylinders laid, the cylinders put together and wheeled. Woodhury & Co. are making the amalgamators.

The material in the drift on the Illinois lode grows better, paying now \$13 or \$14 per ton. The yellow quartz of the Malabar lode, Peru district, produced \$68 per ton, and 70 per cent of lead, two different runs at the Georgetown Smelting Works. The Silver Eagle produced at the rate of \$219.04 per ton, two tons treated at Garrett, Martine & Co's. The Hartwell lode on same creek, produced at the rate of \$240 per ton at Stowell & Litchfield's experimental works, Georgetown.

S. H. Wright, a practical millman of Black Hawk, has leased of the Loker Co. their 8-stamp mill in Chase Gulch.

Capt. Jno. Slawson recently got 95 ozs. of silver from 1,800 lbs. of top quartz ore from the Potosi lode, San Juan.

Denver News, Dec. 18th: We were shown this morning at the First National Bank, two small bars, one weighing 8.96 ozs., fineness, 858½; the other 5.60 ozs., fineness 85½. Also, a quantity of dust and nuggets taken from the California and Tarryall Gulches. Total value of dust and bars, \$2,400.

We were yesterday shown at the branch mint, four bars of hullion, weighing in the aggregate 112 ozs., and valued at about \$2,266. We did not learn the locality from which the gold was taken.

We were shown this morning an assay certificate, belonging to Dr. J. E. Wharton, of an assay made on silver ore taken from the Henry Clay lode, Griffith district, which yielded 715.05 ounces per ton, valued at \$973.26.

We were shown several retorts of gold this morning, at the Colorado National Bank, which had just been received from Central, valued at \$1,300. Also, 8.17 ozs. gold dust from the Arkansas river, of exceeding fine quality.

The *Times* says: We saw a handsome gold bar from one of our Black Hawk companies, at the Rocky Mountain Bank, yesterday. It weighs 300 ozs., and is worth over \$6,000.

IDAHO.

Lewiston Journal, Dec. 12th: The additional ditch to the William & Maxwell mill, in Warren's diggings, is completed. They produced lately over \$1,000 from 4½ tons of rock imperfectly crushed. The Hie Jacket mill will be ready to run by the first of January.

Owyhee Avalanche, Dec. 28th: Wells, Fargo & Co. shipped bullion from this place to San Francisco during the month of December, to the amount of \$105,000, being the product of Owyhee during that time.

Humboldt Register, Dec. 28th: All accounts from the upper country report flush times at Silver City and Ruby City. It is said the prospects have never been better since the opening of the mines. Large quantities of bullion are being taken out, some mines yielding fabulously.

MONTANA.

Herald, Dec. 12th: The company of miners who are engaged in prospecting Gravelly Range, by running a tunnel into the hill, are now working three shifts, of eight hours each. They are now in 200 ft., and the granite bedrock is pitching at an angle of 50 degrees.

Tenderfoot Gulch is played out, and the miners have all left there. Several drain ditches were dug, in order to test the ground but the prospects obtained were not sufficient to justify the building of winter quarters.

In Lost Horse Gulch, a company of men propose, during the winter, to run a tunnel into the bar. They think that there is a rich channel somewhere at one side of the main gulch.

The miners at Prickly Pear Cañon are yet hauling dirt from Peck's Gulch, and are doing well.

Piegan Gulch is getting richer the further up it is worked. The company that own the bedrock flume expect to take out a large amount of gold next season.

A company of men have under contemplation the project of fluming Prickly Pear Creek, somewhere near the cañon, and mining the channel.

About 500 miners will winter at Crow Creek.

Post, 21st: The result of the last clean up at Hendrie's mill for the I. X. L. Co. given last week, should have read 287 ozs.

Turnley's mill cleaned up on last Tuesday, 190 ozs. The rock was from the Park lode.

NEW MEXICO.

Denver News, Dec. 18th: There is a great rush just now to the new diggings at Cimarron, New Mexico. Londoner & Bro., grocers, report that they yesterday outfitted 75 men, who were on their way to the new mines. They report that there are hundreds more on the road.

Hon. E. N. Stearns has shown us a private letter from the Cimarron mines, which asserts the existence of gold there. One Colorado company took from Last Chance Gulch, \$40,000 in three months. Water is now very scarce, and only one company is at work. Mr. Maxwell is bringing water from the Red river, which will give an abundant supply. Many gulches prospect from three to fifty cents to the pan, and Grouse Gulch as high as \$1 to the pan. On Spanish Bar, one company is at work with 8-inch boxes, and with a limited supply of water are making from \$5 to \$15 to the man per day. There are from 300 to 500 men there.

NEVADA.

Union, Dec. 21st: The mill of the Red Mountain & Peak Co. in Silver Peak district is progressing rapidly. Forty men are engaged in its construction. The capacity of the mill when completed, will be 40 stamps, 20 of which, in connection with the necessary machinery, will be in running order by the first day of March. The mines of the company are opening well, and are being thoroughly developed. About 2,500 tons of ore are ready for shipment to the mill.

A letter from Pine Grove states that the prospect of that camp were never more flattering than at present. A large amount of prospecting is being done, and there are few or no idle men to be seen. Mr. Kimball, of Virginia City, has assumed the duties of foreman of the Wheeler mine. The Wilson Co. expect to have their 10-stamp mill in operation about the 1st of January. The mine of this company is now opened in several places and good ore is being taken out. On a number of the more prominent locations work has recently been commenced in a manner that means business.

The much talked of reverberatory furnace of Dr. Dozier at Hot Springs, has been tried, and equals the most sanguine expectations of its builder. We were shown a letter from there, of a late date, which stated that but for an accident by which one of the stones (soapstone) which compose a portion of the crucible was displaced, the test would have been satisfactory; as it was, enough metal has been saved to prove the works a success. The only difficulty now appears in the heating and cooling of the material used in the formation of the crucible, as the chemicals used are of such a nature as to require an intense heat.

Reese River.

The snow on the mountains, and the bad state of the roads generally, have prevented the arrival of our mails from this locality. The cheering countenance of the *Reveille* is wanting in our sanctum; without it we feel lost when we come to make up our weekly summary, as we are always sure of finding something in it that will interest our readers. We suppose it is watching (as its name indicates) the progress of old Sel in repairing the roads, somewhere between this place and Virginia City. When it does arrive, we may expect an extra "batch" of mining news.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Dec. 29th: Messrs. E. B. Briggs and George Sanders, from Gold Cañon, say that it will require six months' work to replace the flumes washed out in that place by the late flood, and will cost the owners the profits of twelve months' running.

Transcript, Jan. 3d: From a private letter received from Virginia City, we learn that great damage has been done by the storm on the other side of the Sierras. Nearly all the mills along the Carson river have been destroyed or very much damaged, and the hauling of ore to the mills is generally suspended.

From the *Trespass* we learn that great damage was done in the vicinity of Virginia to the roads. In the Flowery district a reservoir of tailings was washed away, the loss of which is estimated at \$300,000. Great damage was done to flumes and mining works throughout the State.

SILVER MINES IN MAINE.—Dr. C. T. Jackson, of Boston, has assayed samples of ore from the Industry silver mine, in the State of Maine. He says the value of the ore is eight ounces sixty grains of silver per ton of the concentrated ore, worth nearly \$11 silver being put at \$1.35 per ounce. The value of the rock before concentration will be 2½ ounces of fine silver, or \$3.37 per ton. Dr. Jackson remarks that this discovery of silver in magnesian, white or gray pyrites, is new and of much interest. Our Nevada friends would find no workable value in ore no richer than that above described.

FOR THE TOOTH ACHE.—At a meeting of the London Medical Society, Dr. Blake, a distinguished practitioner, said that he was able to cure the most desperate case of tooth ache, unless the disease was connected with rheumatism, by the application of the following remedy: Alum, reduced to an impalpable powder, two drachms; nitrous spirits of ether, seven drachms; mix and apply to the tooth.

Rocks are said to be "slaty" when they can be split into plates, and "granular" when made up of grains or pieces in the form of imperfect crystals; topaz rock is both slaty and granular; this, we believe, is an exception.

The Glaciers of Alaska, Russian America.

In a recent number of the *American Journal of Science*, Prof. W. P. Blake describes several glaciers in Russian America, which he visited in May, 1863. We make the following extracts:

On approaching the northwest coast of America from the west, the mountain chain of the interior is seen to be lofty and alpine in its character. The ridges are sharply serrated, and rise here and there into needle-like pinnacles, giving an outline against the sky that contrasts strongly with the gently sloping sides of the truncated cone of Edgecombe, a fine extinct volcano which marks the entrance to the harbor of Sitka.

The rocky peaks of the interior rise above broad fields of snow, which give birth to numerous glaciers, while Edgecombe, and the ridges upon the coast, are in great part covered with a dense forest of pines and firs. No glaciers are found upon the coast at Sitka or south of it, for under the influence of the warm currents of the Pacific, the climate is comparatively mild, while a short distance in the interior, the winters are almost Arctic in severity.

In ascending the Stikine river one glacier after another comes into view; all of them are upon the right bank of the stream and descend from the inner slope of the mountain range. There are four large glaciers and several smaller ones visibly within a distance of sixty or seventy miles from the mouth.

The first glacier observed, fills a rocky gorge of rapid descent, about two miles from the river, and looks like an enormous cascade.

The second glacier is much larger, and has less inclination. It sweeps grandly out into the valley from an opening between high mountains from a source that is not visible. It ends at the level of the river in an irregular bluff of ice, a mile and a half or two miles in length, and about 150 feet high. Two or more terminal moraines protect it from the direct action of the stream. What at first appeared as a range of ordinary hills along the river, proved on landing to be an ancient terminal moraine, crescent-shaped, and covered with a forest. It extends the full length of the front of the glacier.

The usual phenomena of glaciers were exhibited on this glacier, such as crevasses, pinnacles of ice, transported blocks of granite, sand cones and glacier tables.

RAILROAD COSTS AND PROFITS IN GREAT BRITAIN AND THE UNITED STATES.—The capital invested in railroad enterprises located in Great Britain is within a small fraction of \$2,277,000,000. The amount similarly invested in the United States, is \$1,517,000,000. The number of miles of railroad in Great Britain is but 13,289, while, with one-third less aggregate cost, the United States has built 36,896 miles, or nearly three times as much as Great Britain. The average cost per mile of English railroads is over \$160,000; while those of the United States have averaged a fraction less than \$42,000 per mile.

The total gross earnings of all the railroads in Great Britain in 1865 was \$179,450,000; total operating expenses, \$85,745,000; net earnings, \$93,705,000. The average earnings of all the railroads in the United States we have not at hand.

In 1866, the gross earnings of the Pennsylvania and Erie railroads, jointly, were equal to 18 per cent. of the gross earnings of all the railroads in Great Britain collectively.

In the same year the gross earnings of all the steam power railroads in New York and Pennsylvania were equal to 66 per cent. of the gross earnings of all the railroads in Great Britain; while the total cost of the former was only 16 per cent. of the latter. Railroad investors in the United States ought to derive much encouragement from such statistics as the above.

COTTON.—It is said that the present price of cotton will not yield to the planter as much profit as six cents per pound did before the war. The supply of American cotton to England this year has been five per cent. beyond that of last year, while the quantity from India has experienced a reduction of 29 per cent.

MILITARY INSTRUCTION IN COLLEGE.—Efforts are being made through the War Office, to introduce a course of military drill and instruction into the principal colleges of the United States. A bill will be introduced into Congress at its present session for the establishment of a national bureau of military instruction, under the direction of which suitable military professors will be appointed to such colleges as are disposed to cooperate in the enterprise, who will be supported at the national expense. It is contemplated that a limited number of college graduates, showing greatest proficiency in military studies, shall have their names published in the *Army Register*, and one graduate per year from each college will be commissioned as Second Lieutenant in the army, on the same footing with West Point graduates. Quite a number of colleges have already signified their willingness to enter into the plan. The readiness with which the students from the various colleges throughout the land repaired to the army, as volunteers, during the late rebellion, has no doubt furnished the inducement to this move. The necessity of a more general military education was terribly felt during the late war, and we know of no better plan to secure it than the one here proposed. It will in no wise interfere with the ordinary routine of study, but will rather aid it by the healthy exercise and more vigorous discipline which will thereby be secured. Major Whittlessey of the U. S. A., under direction of the Secretary of War, has been laboring, for the past year, in maturing this plan, which he has now embodied in the form of a bill, which will soon be submitted.

RELIABLE INFORMATION.—The New York *Stockholder* publishes some information communicated to the General Land Office at Washington, by the Surveyor-General at San Francisco, in the course of which quite a number of towns are described as being located upon certain tracts of land recently surveyed. Among those towns are mentioned Nevada City, Grass Valley, and the town of "Union Hill." As the location of the latter named town has never yet been transferred from the maps of the surveyor to our local county maps, we give a description of it as we find it in the *Stockholder*:

"The town of Union Hill is about two miles east of Grass Valley, and three miles south of Nevada City, and contains three thousand inhabitants, the most of whom are employed in mining. The mines here are mostly the hydraulic placer gold mines, and show no signs of failing."

We commend the above scrap of information to the especial attention of Mr. Bean, trusting that it will find a place in the next edition of his Nevada County Directory.

CURIOUS DISCOVERY.—A French scientist, while examining the contents of the stomach of a mummy, found a small roll, which, after much investigation, he proved to be the skin of the sole of the feet of the mummy itself. Continuing his investigations, he has shown that the post mortem removal of the skin from the sole of the feet was a common practice, and was done as symbolical of the eternal separation of the deceased from the earth which he had so long trod with the sole of his feet—and as a sign of his final manumission from the thralldom of the world.

MIXED.—We saw yesterday, says the *Marysville Appeal*, a laboring party which brought to our mind the mixed people living in our city. A party of six men were lifting a stone, and no two of the six were of one nation. There were a German, Frenchman, Spaniard, Mexican, Chinaman, Negro and Yankee, all speaking the English language. What a country?

In Paris it was recently shown that duck rearing is nearly three times more profitable than hen rearing. The in-duck-tive process of reasoning was used in ascertaining the truth, hence this result.

Fossil Ivory from Alaska.—A correspondent of the New York *Times*, speaks of the discovery of fossil ivory in Alaska. There is much probability that future explorations will reveal extensive deposits of this valuable commercial product in our new possessions. Should such be the case, the discovery will be most opportune, as the sources of supply from which ivory has heretofore been drawn, are rapidly giving out.

ALASKA is expected to become the New England of the Pacific—a Yankee country full of seamen and fishermen, and similar adventurous folks.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

- ANSTED'S Gold Seekers Manual. 1 vol. 12mo. cloth. \$1 75
- ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Rural Fires. By Thomas Antisell, M. D. 1 vol. 8vo. 3 00
- BARSTOW.—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked, With a Chapter on the Blowpipe Assay of Minerals. 1 vol. 12mo. cloth. 1 00
- BLAKE, W. P.—Geological Reconnaissance in California in 1863-4. 4to., with plates, maps, sections, etc. 10 00
- BLAKE, W. P.—Silver Ores and Silver Mines, etc. 8vo. 2 00

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office, Jan. 11, 1868.

Mr. C. T. Roney is our duly authorized agent for Sacramento County. Nov. 23, 1867.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17, 1867.

OUR NEW YORK AGENCY.—Mr. M. A. LATROBE, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No 726 Broadway, for the present. Nov. 26, 1867.

San Francisco:

Saturday Morning, Jan. 11, 1868.

Notices to Correspondents.

J. M., Auburn.—We are not aware of the character of the asserted improved process, which it is proposed to soon put to a practical test at Cerro Gordo, Inyo Co. The latest and only particulars with which we have become acquainted, are that Dr. Dozier asserts that the only chance of failure for his proposed method is whether the crucibles will withstand the destructive action of the chemicals which he proposes to employ in the course of reducing the ores. Now, as these ores consist chiefly of galena, accompanied by a less than ordinary quantity of gangue, and as the mode of treating such is well known, and the most useful fluxes, deoxidants and desulphurants for every variety and for any varied manner of procedure are also equally well known, we do not anticipate hearing of any startling results. Any surprise on our part would rather be to hear of some decided success of a novel character rather than of failure. Dr. Dozier ought to have known whether his chemicals would produce the damaging effect which it appears he is now apprehensive of.

B. S. P., TABLE MOUNTAIN, TUOLUMNE CO. There does not exist any sound reason for supposing that volcanic activity is any less at the present time than during former periods. In the address of the President of the Geological Section (Archibald Geikie, F. R. S.) of the British Association at their last meeting showed very clearly that confining the observations to the British Isles, volcanic activity has increased in force from the Lower Silurian period, up to the Miocene or middle tertiary, culminating at the latter time. Immense as has been the flow of basalts and lavas in various parts of this state during probably even a later period, they are more than rivaled by similar instances in Southern Africa. During the latest historical period, Shapart Jokuhl, in Iceland, has rivaled almost everything exhibited by pre-historic action.

ALBERTUS MINOR.—We believe the cost of the metal aluminum, when purchased in ingots and in quantity, is now reduced to about one-fourth the value of silver. Its production on an gigantic scale, and at a reasonable price, say from twenty-five to thirty cents per pound, would eventually be found a great boon to all civilized communities, and none would proportionally gain more than the Pacific States of America.

F. A., Marysville.—Without any knowledge of the components of the alloy, which you state that you find it sometimes impossible to flux, or only with difficulty making such workable, we are unable to furnish any advice. Perhaps you will furnish us with a more detailed description of the refractory alloy which you alluded to, especially the proportions of the different metals and the varieties of the base ores, if more than one is present. We suspect the trouble will be found in the latter fact.

PARISIENNE.—You are perfectly correct in affirming that your distinguished countryman, Antoine Laurent Lavoisier, was the first chemist who established the fact that the diamond was mere carbon. Lavoisier's scientific career commenced in 1770, and was ruthlessly cut short by the guillotine in 1794, during Robespierre's reign of terror.

A California Steam Plow.

The history of the plow, if we go back to the time when it consisted simply of a forked branch of a tree, dragged over the ground by a single ox or mule, would form an imposing and most interesting volume; and yet it is not necessary to go back half a century, even, to sum up the greater part of the improvements which have been made in this most important implement.

It is within the recollection of many who will probably read this paper, that their grandfathers employed the leisure of their long winter evenings in slowly and laboriously shaping, from the twisted section of an apple tree, a mold-board for the plow; which, with its lower edge shod by the village blacksmith, with a narrow horder of iron, was to loosen up the soil for the next spring sowing and planting. Iron and steel soon altogether supplanted the more perishable wood, and hy-and-hye that humble instrument began to attract the attention of the skillful mechanic and engineer, who commenced at once to study out the law of least resistance as thereto applied, until the true curve was finally deduced. Since that time, Scott Russell's wave-line, as applied to floating bodies, has not been more scientifically applied than is the same principle to the production of the plowshare.

The next move was to apply the universal motor, steam, to the driving of the plow, instead of slow and expensive animal power. To accomplish this, various devices have been resorted to. Chief, and most successful among experimenters in this direction have been the Messrs. Fowler and Mr. Howard, both, we believe, of Leeds, England. We have no space, at the present time, to go into the interesting particulars, which, within the past five or six years, have eventuated in such important results as have been arrived at by those gentlemen—the absolute demonstration of the practicability of steam plowing and cultivation. So important was this considered, at the outset of their experiments, or just before, that Mr. Bronson Murray, a leading and wealthy farmer in Illinois, offered a reward of \$50,000 for a practical steam plow. Whether this reward has ever been claimed and paid, we know not; but if not, and if the offer is still good, we trust the claims of Messrs. Coffin & Standish, whose first experimental trial we now propose to describe, shall be duly considered, both on the grounds of superiority over all others, and from the fact that it is an American (California) invention.

FIRST TRIAL OF THE COFFIN AND STANDISH OR "MAY-FLOWER" STEAM PLOW.

We have no space to go into the details of the construction and working of either the Fowler or Howard plows, or of the various other, but unsuccessful devices that have been from time to time essayed in various parts of the United States. In our issue of December 28th we gave a somewhat detailed description of the plow recently invented by Mr. Standish, of Martinez, and briefly contrasted it with the English steam plows. On Monday evening last we received a telegraphic dispatch from the inventor, saying that the first trial of his plow would take place on the afternoon of the next day, and inviting us to be present. In company with quite a number of others from this city, who received a similar call, we took the Suisun boat for Martinez on Tuesday morning. On the arrival of the boat, we found the main street of the village crowded with a great number of persons, who had come together, from the town and neighboring country, to witness the trial. The plow, or rather its locomotive carriage, with the stars and stripes floating above it, was then working its way slowly through the mud-holes in the street to the Common, just beyond the village, where it was soon set to work.

A perusal of the article already referred to will inform the reader of the principle on which the plow operates. The chief object of this trial was to determine how the principle would work practically. The result was more than satisfactory—not one of those present, including a large number of

skillful and practical farmers, questioned its practicability; while the manner in which the work was done seemed to have exceeded the anticipations of even the inventor himself.

The plow was set to work upon a hard, wet, adobe soil, covered with grass—an open common by the side of the road—which had been subjected to the tramping of the people and of cattle over since the town was settled, and which had never been disturbed since the time the whole country roundabout was turned over by the up-throw of Mount Diablo. The admiration of every one was excited to see the rapid whirling and cutting of the knives—which constitute the plow—cutting, tearing, stirring up and turning over the compact and cohesive adobe soil; penetrating below the grass roots and throwing up and exposing the earth to the aerating and fructifying influences of the atmosphere.

We watched with astonishment, the effect produced by this truly novel instrument. Surely the hosom of old mother earth was never before tickled in such a vigorous manner. Such an upheaving of the soil, such a throwing, stirring and pell-mell distributing of it through the twelve foot swarth which the machine cut, as it locomoted forward, was never before seen. The superior manner in which the work was done was the admiration of every one. No other plow ever invented, even if followed by a dozen harrows or other pulverizers, could have so completely pulverized and loosened up for the free admission of air, wind and rain, that plastic, fatty, adobe soil. We could compare the machine to nothing but a huge and most effective sausage-cutter. If the soil had been dry, it must have pulverized it to the finest dust, and left it like a freshly made ash heap.

The mechanical details of the machine are, as yet, far from being perfected; although no difficulty whatever is apprehended in this direction. The success of the principle, only, was sought at this trial, and we congratulate the ingenious and fortunate inventor on the result which he has attained. We have the fullest confidence that every mechanical defect and deficiency can be easily overcome. In the course of the trial, the arms which supported one set of knives were broken off by the latter coming in contact with an unseen boulder; but the machine will but seldom be needed to work in soil where boulders occur. Loose stones will not interfere with its working; and the inventor proposes to arrange the knives with adjustable holders, which will accommodate themselves to any obstructions whatever.

The greatest difficulty will probably be to construct a machine sufficiently light, and retain at the same time the necessary strength to locomote itself over the ground, in advance of the plowing. The combination of lightness with strength, in steel, which may be taken advantage of throughout—in boiler, engine and plow—will doubtless render that both practical and reasonably cheap. But we have no room to follow this subject further. We propose to say a word next week upon the superiority of steam over ordinary plowing, in improving the land, in bringing about an increased yield of crops and in point of economy, and will close the present article by merely adding that in the minds of all intelligent thinking men the steam plow has a grand mission to fulfil in America, and nowhere will its use be found more important than in the fertile valleys, and in the midst of the high priced labor of California. Messrs. Coffin & Standish are the proprietors of this invention.

ANNUAL MINING REVIEW FOR 1867.—We devote a large space in our columns to-day, to a very full and carefully prepared mining review for 1867, for which we are indebted to our neighbors of the *Commercial Herald*. This review will be found of much value, and should be carefully read and considered by all who are interested in the progress of the mining interests of California. The *Herald* has done a good service to the industrial interests of the State, generally, in the production of this paper, only a part of which appears in our present issue.

PARLOR CONCERT.—Mr. Walter S. Pierce gave an entertaining concert, at his piano rooms, on Market street, on Tuesday evening last. The music was of a high order, and selected with judgment. Some of the first musical talent in the city was engaged for the occasion, and all acquitted themselves with credit. We trust Mr. Pierce will give us more. Any one who aids in the cultivation of a refined taste for music in the community, should receive its thanks and support.

Foundry Work—Fulton Foundry.

Our friends, Hinchley & Co., of the Fulton Foundry, on Fremont street, appear to be doing a thriving business at this time. We dropped in at their establishment a few days since, and in looking around gathered the following items of foundry and machine work there in progress, or but recently sent out:

They are now engaged upon two engines for Simpson's Dry Dock, now in process of construction at Oakland Point, but designed for permanent location at some point on this side. Eight pumps will accompany these engines, to be employed in rapidly freeing the dock from water, after it has received its load.

They are building two mining pumps for the New Almaden Quicksilver Mining Co., and a hydraulic pump and press for the Pacific Powder Mill Co. in Marin county. The power of the press will be six tons to the square inch.

The same foundry is getting up the machinery for a large double circular sawmill with shafting, mill irons, etc., for Mr. Duff, to be located near Hnmholdt Bay. This mill will have one of Hendy's patent gang mills attached.

They have also just sent off the machinery complete for a double circular-saw mill, for Stanford Bros., which is to be located in the Sierra Nevada Mountains, near Donner Lake.

They are also engaged in getting up the machinery for the manufacture of the new powder, which will be prepared and sold by the "Giant Powder Co." These works will soon be in readiness for supplying this market with this new and terribly effective, yet very safe explosive agent.

Brodie's crushers are manufactured at this foundry. One of these machines was recently ordered for the Western company's mill, at Silver City, near Nevada, where it has given such satisfaction that another has been ordered for the same vicinity by Golden Rule & Co., which has just gone forward. This mill is capable of preparing forty tons of rock for the stamps every twelve hours.

A SUPERIOR CAST IRON

Has recently been introduced to the public through this foundry. It is a French production, and has latterly received much attention from the French Government—it being considered the best iron yet produced for casting cannon. It is used here principally for hydraulic presses, crushers, shoes, dies, etc., where an extremely hard and tough iron is required. This iron is remarkable for the readiness with which it chills. It will chill from an inch to one and a half inches deep. Two brands of this iron are made, one of which is hard and tough, and the other soft and tough.

HAYES' IMPROVED STEAM PUMP

Is also manufactured at this foundry, where one of them can at all times be seen and examined. This pump is pronounced by engineers and other persons competent to judge of its merits, and who have used it, as most simple, durable, compact and but little liable to wear. Perhaps its most important advantage is found in the extreme simplicity and adjustableness of its valves. The valve motion of this pump is obtained by a simple taper plug, with the valve placed within the plug and below the water ways. It makes its own joints, and can be removed at any time for examination, cleaning or repairing, by simply removing a cap which is held by a single screw. The removal of the cap allows the plug, containing the valve, to be drawn out and cleaned or adjusted. That operation requires but a moment of time, and the plug is perfectly convenient of access. The Pacific Mail Steamship Company, under the advice of their Superintendent, Mr. Pollock, have had one of these pumps placed upon their new steam transport, which has just been constructed at this port, for use in the Bay of Panama, and which will leave for its place of destination in a few days. These pumps are now made of two sizes; each of large capacity. The inventor proposes to construct a smaller one, to be used as a feed pump for steam boilers, for which it appears to be peculiarly applicable.

NEW MAP OF THE PACIFIC STATES.—H. H. Bancroft & Co., of this city, have just published a handsome map of California, Nevada, Utah, Arizona, Oregon, Washington, Idaho and Montana. It is on a scale of twenty-four statute miles to the inch, and is in size about four feet by four feet and a half.

It comes in good time. Such a map was needed. The changes that have taken place since the latest previous maps were prepared, by the settling up of new sections of the country, the creation of new counties, and the opening of new mining districts, in Southern California, Southern Nevada, Montana, Arizona, etc., have made necessary a good deal of guess-work, even with the aid of the best of these maps. This one is the first, we believe, which gives in full the California counties of Kern, Inyo and Mono, etc., etc., with the new and promising mining regions which they include. Also the Silver Bend and Pahrangat districts in Nevada.

The lettering of the map is clear and distinct, and the coloring done in such a manner that the outline of each county is defined at a glance. The area of each State and Territory in square miles, with its population, and divers other statistics, is given. The map will make a handsome and a useful wall ornament for the office or the study.

PACIFIC COAST ALMANAC.—Henry G. Langley has just issued a neat and useful little publication entitled "The Pacific Coast Almanac and Year Book of Facts for 1868." The work is of large duodecimo size, and comprises 98 closely-printed pages. The synopsis and tables given, bear evidence of the usual care and precision of that well known statistician—they are compact and concise, and contain in a small space a vast amount of valuable matter. It is to the Pacific coast; what the Tribune almanac is to the Atlantic coast. In addition to the usual astronomical calculations and calendar, it contains the most important of the recently passed National and State laws; the constitutional amendments; the various departments of the National and State government; lists of foreign ministers; Members of Congress; post offices; tables of population; notices of courts; State institutions; State finances; National and State expenditures, finances, etc., etc. One of the most valuable features of the work is a concise review of the resources, manufactures and minerals of California. As a whole, it will be found extremely valuable for daily reference among all classes of the community. Price, fifty cents.

PETROLEUM AS STEAM FUEL.—TESTS TO BE MADE IN SAN FRANCISCO.—Dr. C. G. Page and James D. Linney, arrived in this city by the steamer of the 2d instant, to make some practical tests here of Foot's invention for burning petroleum for steam fuel. The latter named gentleman was the constructing and operating engineer in the experiments which have been made, the past summer, in several of the Atlantic cities. The time and place of the preliminary experiment here will be announced this evening or on Monday. It will probably take place about the middle of next week.

We understand that arrangements are also in progress for a trial here, of a similar invention made by Mr. White, of this city. This invention was successfully tried some two or three months since upon a stationary boiler at Santa Cruz. The experiment will soon be repeated in this city, and probably on one of the city fire engines. The rivalry of these two inventions—California vs. New York—will lend additional interest to these proposed trials, each of which will be fully reported in this paper.

PETROLEUM FOR FUEL.—The Secretary of the Navy states, in his annual report, that \$5,000 has been expended for petroleum with reference to its use as fuel for steamers in place of coal. The conclusion arrived at was that petroleum is not as good as coal.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Those marked with an asterisk () are advertised in this journal.

NEW POWDER WORKS.—We understand that the "Giant Powder Co." which has been organized with the view of manufacturing the new blasting powder, which attracted considerable attention in this city last spring, and which was tried on the line of the Day View Railroad, beyond the Potrero, will soon be ready to commence the manufacture of the article for this market. It will be recollected that the company's expert, who came out from Germany to superintend the manufacture, died, very suddenly, soon after his arrival, which necessitated the sending for another person to take his place. Such a party has recently arrived, and the machinery and appliances necessary for the manufacture are now in process of construction at the Fulton Foundry.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows: **SAN JACINTO TIN CO.**—San Francisco. Jan. 3d. Capital stock, \$400,000; 40,000 shares, \$100 each. Trustees: E. Conway, H. W. Carpenter, L. L. Robinson, Edward K. Carpenter, W. H. Patterson and Samuel F. Butterworth.

GOLDEN GATE HOMESTEAD ASSOCIATION. San Francisco. Jan. 3d. Capital stock, \$99,200; 810 shares, \$320 each. Trustees: Fred. Loehr, J. Gundlach and Emil Kower.

STOW FOUNDATION CO.—San Francisco. Jan. 8th. Capital stock, \$500,000; 5,000 shares, \$100 each. Trustees: H. F. Williams, Edmund Scott, E. W. O'Neil, Geo. Hearst and Charles M. Tyler.

NEWSPAPERS IN ENGLAND.—The circulation of the London daily journals is set down at a little over 2,000,000 for the present year against 360,000 in 1851. The necessity for every man to take a paper is almost as universally acknowledged in England as in the United States.

PHOTOGRAPHS are now taken on the dial plate of watches—a very pretty idea, especially in the holiday times. A watch, thus photographed, must be treasured with vastly more regard from the constant presence of the likeness of the giver, brought to view every time it is opened.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

OLNEY & CO., ARCHITECTS and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 315 Montgomery street, San Francisco. 1v10

SECRETARYSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15r

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 2v15 3m

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. **DR. BEERS,** corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 1v14 1f

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required. **WM. MACDONALD & CO.,** Gen'l Agents, 121 Montgomery st., San Francisco, Opposite Occidental Hotel. 2v16 3m

Builders' Insurance Company—OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street. **FIRE AND MARINE INSURANCE.** 1v14 9pqr

Perry Davis' Vegetable Pain Killer.

Sudden colds, coughs, etc., can be cured immediately, as hundreds can testify, by mixing about one teaspoonful of Perry Davis' Vegetable Pain Killer with four tablespoonfuls of molasses, mixed well together, and taken as your coughing spell comes on; three teaspoonfuls of the mixture will answer for a dose. Also rub a little of the Pain Killer on the hands, and inhale the scent of it into the lungs. After you have taken the medicine, bathe the throat and around the collar-bone, also across the upper part of the breast and down the sides, if they have been made sore by coughing, and you will soon get relief if you do not neglect it too long. The sooner the medicine is applied, the more speedy the relief. In all cases, if you do not get relief in thirty minutes, take it again, and bathe freely according to directions.

Prices, 25 cents, 50 cents, and \$1 per bottle. Sold by all Druggists, Grocers and Medicine Dealers everywhere. declm

Legitimate Photography OUR SPECIALTY.

THE FIRST PREMIUM AWARDED AT the late State Fair for the best plain Photographs, and a special premium for the best Cabinet Portraits, to **SILAS SELLECK, 415** Montgomery street. Prices reduced to conform to Association rules. Patent secured. 2v15 6m

Foundry for Sale.

A One-half Interest in the **UNION IRON WORKS, SACRAMENTO,** Owned by William R. Williams, is offered for sale on the most favorable terms.

A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 183 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address **WILLIAM R. WILLIAMS, Sacramento, Cal.** 2v15 11f-16

Oakland College School.

THE PATRONS of this Institution have the choice of several distinct Departments. The **SENIOR CLASSICAL** is designed as preparatory to the College of California. The **SENIOR ENGLISH** affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art. The **JUNIOR** is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided. Throughout all the various departments, great attention is given to the study of the Modern Languages. For further information, or Catalogues, address, **I. H. BRAYTON, Principal.** OAKLAND, California. 5v15qr9p.

ROOT'S Patent Force Blast Blower.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 per cent. less power than any Blower now in use. For further particulars, address **KEE, BLAKE & CO.,** Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15 11f-9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag, screw and Drop Presses, Coaling Machinery, Pile Drivers, Bark and Mill Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. H. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curved Pan, Zeller's improved flat bottom pan, Felder's pan, Vetch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH & CO. 2412

ORIGIN OF A NEW INDUSTRY.—Some time since a hatter in Brooklyn, N. Y., for the fun of the thing, promised his wife that he would make her a skirt—such as was never before known. He took some felt, and adopting the beating process by which felt hats are made, he streaked the material over a frame and beat it in successive layers till a thick, full sized seamless skirt was made impervious to rain or damp, warm and not heavy; it was regarded as a wonder by the ladies of New York. More were demanded. They became the rage, and an immense factory has been opened, 100 hands employed, and yet the demand cannot be supplied.

THERE are nine establishments in Massachusetts for the manufacture of spool cotton. The value of stock used for the year ending the 1st of May, 1864, was \$865,538; value of cotton made, \$1,336,098; capital invested, \$990,500; hands employed, 867.

OYSTERS are said to be so tenacious of life as to continue their heart-beatings for half an hour after they have become engulfed in the human stomach.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—but are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.
Lunenburg, by Bremen mail—3 cents each.
Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.
Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—4 cents each.
Italy, by Bremen or Hamburg—3 cents each.
Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mails, via Trieste—3 cents each, and 2 cents per ½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.
Hamburg, by Hamburg mail—1 cent per ounce.
Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.
Lunenburg, by Bremen mail—1½ cent per ounce.
Lunenburg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.
Schleswig-Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.
Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.
Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per ½ ounce.
Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per ½ ounce.
Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail, via Trieste—1½ cent per ounce, and 2 cents per ½ ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

ELECTROTYPING CUTS, ENGRAVINGS, Etc.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

SCIENTIFIC NONSENSE.—It is said that Andrew Jackson Davis, the well-known spiritualist, will shortly publish a new book entitled "Stellar Key to the Summer Land," which Mr. Davis claims contains "Scientific and Philosophical evidences of the existence of an inhabitable Sphere or Zone among the Suns and Planets of Space."

The whole of the sewage system of Woolwich is to be connected, for ventilating purposes, with the tall shaft of the steam factory department, and remarkable sanitary results are expected.

The Paris Exposition gives 16,000 medals, and as each will be specially struck with the name of the recipient, they will not all be ready before March next.

A GENTLEMAN of N. Y. has devised a method of mutilating postage stamps, which he thinks will be effectual. Only gum half the stamp, he says, and let the clerks in the post office tear off the other half.

Hops.—The hop product of the United States last year is estimated at 20,000,000 pounds, of which 7,000,000 are credited to Wisconsin.

National Mineral Land Law, Instructions. Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address Dewey & Co., office Mining and Scientific Press, San Francisco.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents.
Over \$20 and not exceeding \$50.....25 cents.
No fractions of cents to be introduced in an Order.
United States Treasury Notes, of National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained.
Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:
No. Amount Date, 1867

MONEY ORDER.

Required for the sum of \$.... Payable at
State of Payable to Residing at
Residing at State of Sent by
Residing at State of
EXTERIOR IN REGISTER.

The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given names of married women must be stated, and not those of their husbands. For example: Mrs. Mary Brown must not be described as Mrs. William Brown.

Names of parties and places, and the sums, to be written in the plainest possible manner.
As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Chay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine hauler or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The MINING AND SCIENTIFIC PRESS is now in its FIFTEENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1866:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the MINING AND SCIENTIFIC PRESS, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3. In advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

As an advertising medium throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free.

DEWEY & CO.,
San Francisco.

THE GOLDEN ERA.

Founded in 1851, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

Rates of Subscription:

(variably in advance.)

One year.....	\$5.00	Six months.....	\$3.00
Three months.....	\$2.00		

TERMS TO CLUBS:

Three copies one year.....	\$12.00

Machinery and Castings of all kinds, either of Iron or Brass.

Boilers and Sheet Iron Work in all its Branches.

Shoes and Dies of White Iron, manufactured for and imported by us expressly for this purpose, and will last 25 per cent. longer than any other made on this coast.

Russia Iron Screws, of any degree of thickness. We are the only manufacturers on this coast of the "Hicks Engine," the most compact, simple in construction, and durable, of any Engine in use.

W. H. HOWLAND E. T. KING,
H. B. ANGELL, CYRUS PALMEZ,
13v14-qr

BAURHYTE, McAFEE & SPIERS, BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, sin ply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas, but not the practical experience necessary to put the same in form, by making Drawings of their inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions.

New Mining Advertisements.

Die Padre Gold and Silver Mining Company,
 Alamos, Mexico.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the tenth day of Janu-
 ary, 1868, an assessment of five dollars (\$5) per share was
 levied upon the capital stock of said Company, payable
 immediately in United States gold and silver coin, to the
 Secretary at his office, corner Broadway and Battery
 streets, San Francisco, Cal.

Any stock upon which said assessment shall remain un-
 paid on the eleventh day of February, 1868, shall be de-
 deemed delinquent, and will be duly advertised for sale at
 public auction, and unless payment shall be made before, will
 be sold on Thursday, the fifth day of March, 1868, to pay
 the delinquent assessment, together with costs of adver-
 tising and expenses of sale. By order of the Board of
 Trustees.

E. C. McCOMB, Secretary.
 Office, corner Broadway and Battery streets. jan11

Lady Bell Copper Mining Company, Low Di-
vide Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the eighth day of Janu-
 ary, 1868, an assessment of fifteen cents per share was
 levied upon the capital stock of said Company, payable
 immediately, in United States gold and silver coin, to the
 Secretary, or to J. K. Johnson, at Crescent City.

Any stock upon which said assessment shall remain unpaid
 on the tenth (10th) day of February, 1868, shall be de-
 deemed delinquent, and will be duly advertised for sale at public
 auction, and unless payment shall be made before, will be
 sold on Monday, the second day of March, 1868, to pay the
 delinquent assessment, together with costs of advertising
 and expenses of sale. By order of the Board of Trustees.

B. P. WILKINS, Secretary.
 Office, 618 Market street, San Francisco, Cal. jan11

Mount Tenabo Silver Mining Company.—Lo-
cation of Works: Cortez District, Lander County, Ne-
vada.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the fifth day of January,
 1868, an assessment of two dollars and fifty cents (\$2.50) per
 share was levied upon the capital stock of said Company,
 payable immediately, in United States gold and silver
 coin, to the Secretary, 426 Montgomery street, San Fran-
 cisco, California.

Any stock upon which said assessment shall remain un-
 paid on the twelfth day of February, 1868, shall be de-
 deemed delinquent, and will be duly advertised for sale at public
 auction, and unless payment shall be made before, will be
 sold on Thursday, the twelfth day of March, 1868, to pay the
 delinquent assessment, together with costs of advertising
 and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.
 Office 426 Montgomery street, San Francisco. jan11

P. S.—An allowance on the above assessment of three per
cent. will be made on all payments prior to the 3rd inst.
By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.

Nuestra Señora de Guadalupe Silver Mining
Company.—Location of Works: Tayoltita, San Dimas
District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of
 Trustees of said Company, held on the third (3d) day of
 January, 1868, an assessment (No. 30) of one dollar (\$1) per
 share was levied upon the assessable capital stock of
 said Company, payable immediately, in United States
 gold and silver coin, to the Secretary, E. J. Pezzarini,
 at the office, No. 210 Post street, or to the Treasurer, A. Him-
 melmann, at his office, No. 637 Washington street, San
 Francisco.

Any stock upon which said assessment shall remain un-
 paid on the tenth day of February, 1868, shall be de-
 deemed delinquent, and will be duly advertised for sale at public
 auction, and unless payment shall be made before, will be
 sold on Tuesday, the third day of March, 1868, to pay the
 delinquent assessment, together with costs of advertising
 and expenses of sale. By order of the Board of Trustees.

 Trustees of said Company, held on the eighth day of Janu-
 ary, 1868, an assessment of one dollar and fifty cents (\$1.50)
 per share was levied upon each and every share of assess-
 able stock of the capital stock of said Company, payable
 forthwith, in United States gold coin, to the Secretary,
 southwest corner S.ewart and Folsom streets, San Fran-
 cisco, Cal.

Any stock upon which said assessment shall remain un-
 paid on the tenth day of February, 1868

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have been constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular way between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,

San Francisco.

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers
Pumps, Pumping
Frames and
Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by an operator.

HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order.

No. 28 Second St., and 108 and 110 Jessie St. San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

Corner First and Mission streets, or Box 2,077
3v13f SAN FRANCISCO.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this little machine, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address

Dr. J. B. BEERS, San Francisco,
Ter Wells, Fargo & Co's Express.

1v14q

PATTINSON'S
HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

THOMAS PATTINSON

Changing the Address.—No charge is made for changing the address of this paper. Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the crushers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price \$600

No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price 850

No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price 1,300

EXPLANATION OF THE ABOVE CRUSHER.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is held by a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaw, and the dotted line represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Raywilde Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Raywilde Ranch" Mine, in Tuolumne County:

Raywilde Ranch, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco, Dear Sir:—I beg to please to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Raywilde Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
Supt. Raywilde Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the future, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

JAMES BRODIE, Fulton Foundry, or CHARLES RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

THE CELEBRATED
Self Generating Portable
Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It can be either smoked or smelt, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of only one-third of the cost per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap, and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to crush the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vice and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rope one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v13m-8

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools.

To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Seelt.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hall.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text-books.—James Deiman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Win. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brydson.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates of the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exceedingly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boile.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his command, and who seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so much an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in media res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, he should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an anecdote in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

PRICE, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

DISTRESS IN NEW YORK.—The New York

World of Dec. 10th, says: Of the 28,000 artisans employed in the jewelry business, 40 per cent. are out of employ; carpenter's wages have been reduced from \$3.50 to \$2.50 a day, and only one-half of the journeymen can find employment; of hatmakers, there are 400 who can get work but one day in six; of the 20,000 tailors in the city, one-quarter are unemployed, the quantity of work for them is 30 per cent. less than that assigned them at this time last year, and their wages have been reduced by 33 1/2 per cent.; the ironworkers say that their business has not been in twenty years so dull as it is now; at least, 1,000 shipwrights are out of employ, and from one end of the East river to the other but five vessels are building, of which two are steamboats, two are ferryboats, and one is a sailing vessel; and, to close this sad list, it is estimated that 3,000 servant girls are seeking places, but find none. Such facts as these do not need comment. Attribute them to whatever cause one may, the statement remains that thousands of men and women in the metropolis who depend for a living upon daily labor can find no employment; they are willing, nay, anxious to work, but there is no work for them to do. How they are to survive the winter they dread to forecast. Want stares them in the face. Relief is too far to be within sight. Yet they must live, and it is not improbable that many of them may be objects of charity ere the spring returns. Probably few of our citizens are aware of the state of affairs thus presented; but unless a change for the better takes place (of which there is no immediate prospect) New York will see as much distress as it did in the winter of 1857-8, when processions of men, women and children were no uncommon thing.

THE EMPIRE OF THE POPE.—What is this Empire of the Pope which is just now the theme of universal contention? We learn from some statistics presented to the International Statistical Congress recently held in Florence, that "The area of the papal states is at present 11,000 kilometres, the length of coast 550 kilometers, 50,000 hectares of land being marshy and uncultivated. Two-fifths of the buildings and a third of the land in Rome belong to the Church. Since 1847 the lay population has increased from 176,000 to 215,000, and the clerical population has doubled. There has been no progress in the industry of the country in the last forty years. In 1813 there were 39 wool factories, which still exist. The proportion of soldiers to the population is 23 in 1,000, which is more than in Prussia, and accounts for the enormous deficit in the papal budget."

AN EMINENT IRON MASTER DEAD.—Wm.

Burden, the eminent iron master of Troy, N. Y., died on the 6th ult. He was of the firm of Burden & Sons. The firm now consists of two brothers of the deceased and the father, who, at last accounts, was lying seriously ill. Their works cover acres of ground, and whole squares of buildings. The iron they make is said to be superior to English, and nearly equal to the best Swedish.

FOR THE SCIENTIFIC.—It is said, on what authority we know not, that a reward of \$10,000 is offered for the discovery of a process to soften mica.

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thanks for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness:

GEORGETOWN, January 22, '67.
MESSRS. DEWEY & CO.—Sirs: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Laters Patent" on my application through you for an "Improved Machine for Washing Ores."
It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf.
Very truly yours,
A. A. WOODSIDE.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—Tribune Union.

Postage.—The postage on the MINING AND SCIENTIFIC Press to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

A Hint.—Brickmakers may find an interesting hint in a recent number of Harper's Weekly, which advises them to have a stamp in every brick mold, giving the name, date, and locality of manufacture, not only as a useful advertisement for them and their business, but likewise as an assistance to futuro investigators and historians. Such trade-marks were common among the Roman, Egyptian and other ancient brick-makers, and have rendered valuable aid to historical writers of modern times in verifying dates, and filling up gaps in the annals of the past.

PEACHES.—A Florida fruit grower says the report current that peaches will not grow in Florida—or that, in going south, where oranges commence peaches end—is not true, as no State in the Union will produce either peaches or oranges to greater perfection than Florida.

SULPHUR FOR DIPHTHERIA.—A Scotch doctor has published a tract announcing that he has discovered in sulphur a sovereign remedy for diphtheria, and all diseases of minute fungus growth.

Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
- II. Diagram, Description of Diagram and Boundaries, and Notice.
- III. Register's Order for Publication—with Notice.
- IV. Deposition that Notice has been Posted.
- V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cents per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cents. Address **DEWEY & CO.,** Mining and Scientific Press, San Francisco.

FARMERS' AND MECHANICS' BANK OF SAVINGS.

225 Sansome street, near California.

Incorporated under the Act of the Legislature of California, approved April 11th, 1862.

CAPITAL STOCK, \$150,000.

DIRECTORS:

N. C. Fassett, George M. Condee, Benben Morton,
G. H. Wheeler, Isaac E. Davis, James Laidley,
Henry Dutton, B. H. Freeman, Samuel L. Palmer,
G. H. WHEELER, Cashier. N. C. FASSETT, President.

Deposits received in gold, silver or currency, payable in like kind, at sight. Funds may be sent by express, or in registered packages by mail. Receipts will be promptly furnished.

We will receive Gold Dust and Bullion, for refining or assay; make advances on the same, and return proceeds promptly.

Best Bankers' Drafts, on all parts of the world, furnished at lowest rates, by addressing us. Write names plain. Checks of all banks taken.

Money loaned only on first-class security, safety being our first consideration.

The Highest Rates of Interest paid on Gold Deposits.

DEPOSITS RECEIVED IN SUMS OF \$1 AND UPWARDS.

We will keep safely all bonds deposited with us; collect and remit the interest to our friends in the country, as may be directed. For further particulars, address

ELLERY'S

Patent India Rubber Paint and Cement

Is composed of India-rubber and other gums, dissolved in pure linseed oil, mixed with the various coloring matters, and ground in any color. We paint Wood, Brick, Metal, Cloth, etc. It is a superior Marine Paint. Will not rot, peel, blister or crack in any climate. Fifteen hundred Fish Vessels at Gloucester, Mass., use it as superior to other paints. We refer to Steamers American, Scunior, Paul Perry, Julia, etc., and W. K. Van Allen, S. C. Bugbee & Son, Tabbs & Co., C. W. Thomas, Sidney Johnson, Dr. Houston, Gen. Connor, Stockton, H. L. Davis, Jas. Lick, J. P. Pierce, Esqs., and others. Filbert Street School House, two coats on redwood, equal to three coats lead. One hundred pounds paint equal in bulk to two hundred pounds lead. Cementing and painting new or old Tin or Metal Roofs. We first cement around fire walls and skylights all holes and cracks, then apply a good coat of paint. A good, clean, tight roof is certain. Price, from one to three cents per square foot, according to size and condition of roof.

New Cloth Roofs put on, saturated with liquid rubber; then painted at nine cents per square foot. We use none but the best materials and pure linseed oil. No lead turpentine; neither asphaltum or coal tar.

Also, for sale, "Sulphurine Rubber Varnish," \$5 per gal. long; any color. We will apply to Vessels' Bottoms, or furnish at \$5 per gallon. 2215 1/2

McMillan, Lexington, Santa Clara County. 2215 1/2 3rd St. for Circular to **KNAPP & GRANT,** Agents for California, 310 Washington street, San Francisco.

**BLAKE'S PATENT
QUARTZ CRUSHER.**

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a resurvey of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Up-right Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages.

Several infringing machines are made and offered for in this city, upon which Patents have been obtained. Infringers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. **BLAKE & TYLER,** Agents for the Pacific Coast. 1214 1/2

HUNGERFORD'S

Improved Concentrators.

MR HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Goss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to. 2215 1/2 MORGAN HUNGERFORD.

**Notice to Miners,
Well-Borers and Water Companies.**

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done. **M. PRAG,** 813-1/2 Stove Store, No. 125 Clay street, below Davis.

NOTICE TO MERCHANTS

—AND—

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz. Greater strength; less danger in working, as goods require no slinging or handling, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any lashing or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

Petroleum For Steam Fuel.

The consumption of fuel in the furnaces of land and marine engine boilers—the best class of fuel to be used, and the best possible manner of consuming it, so as to utilize the highest percentage of heat evolved from its consumption, has become one of the most important, if not indeed the most important mechanical and commercial question of the day. The supplanting of nearly all other motive power by steam could never have been accomplished, to anything like even its present extent, had it not been for the introduction of coal to take the place of wood. In England the great fear now is the exhaustion of the coal fields. In this country the chief difficulties are the high price of coal, and the necessity for a still more condensed fuel to enable us to make, with due regard to economy, the long voyages incident to our rapidly increasing commerce on the Pacific.

IMPORTANT CONSIDERATIONS.

The United States is just now stretching forth her arms to grasp the prize, which has been the contest and ambition of nations ever since Solomon made his famous treaty with Hiram, King of Tyre—the control of the world's traffic with the Indies. To gain this end, we have long been striving to secure the entire available "water front" of the greatest ocean on the globe, we have undertaken the construction of the most gigantic railroad enterprise ever attempted, and we have established the most magnificent steamship line ever conceived by man! In each of these enterprises we are succeeding beyond the most sanguine anticipations of their original projectors, and our success thus far has challenged the admiration of the world. The skill of our engineers and naval architects, and the energy, confidence and ability of our capitalists, has proved all that the exigencies of the situation has required. The last triumph, which may perhaps be considered the greatest and most important consummation which has been attained in all the train which has thus far led us straight forward to the goal of our ambition, is the practical substitution of petroleum for coal and wood in making steam.

Experience has shown us that we had well nigh failed in the very moment of apparent victory; for we hold it as a demon-

strated fact that the successful prosecution of the long voyages between this port and the commercial centers of the East Indies, cannot be made to stand against the combined opposition, aided by frequent coaling depots which will be brought to bear against us, when, by the completion of our continental railroad, we shall be prepared to make our final determined effort to secure the world's traffic with the East. To do this, we shall need an advantage which was but little considered when we entered upon the contest—we must have a condensed fuel which will give us that room in our steamers for freight, which is secured to our European competitors by the frequent coal-

our contemporaries, with the progress which Col. Foote has made in this direction. They have also been informed that two of his agents have arrived in this city, to repeat here his New York and Boston experiments, which have attracted so largely the attention of the world during the past summer. To this end they brought out the identical apparatus which has been so long used in the experiments at the Battery in New York, and which is here shown, with all its imperfections, both in construction and wear. This apparatus has been put up, and is at work, propelling the machinery of the brass foundry and machine shop at 417 Mission street, where its practical operation has been wit-

always red hot, they serve to insure the ignition of any particles of carbon which may not ignite before reaching them. E, E, E, is a steam coil made of iron gas pipe and loosely filled with iron borings. In use it is always kept red hot by the burners beneath. Steam enters this coil at the point, F, and after passing through it, enters the retort at each end through the pipes, G, G. H is a pipe connected with a small air-pump, which forces air through it into the retort at the point, I, at a pressure of about half a pound to the square inch. K is a pipe which conveys gas from the retort to the burner, L, beneath it, where it burns and keeps the bottom of the retort at a red heat.

Perhaps the practical operation of the apparatus will be better understood by describing the manner of kindling the fire at the beginning. In starting with everything cold, a handful of shavings or kindling wood is lighted and placed beneath the retort for a few minutes, until its bottom is hot enough to vaporize the oil, when crude petroleum is permitted to run slowly from a tank (which may be placed at any distance, but above the furnace,) through the pipe, B, into the retort. Here, coming in contact with the heated bottom, it is at once vaporized, and its gases fill the retort, and, passing out through the arms, C, C, and the flutings in the stems of the burners, D, D, burn with a heavy and smoky flame.

As soon as steam is obtained in the boiler, it is allowed to enter the retort at the point, F, the red-hot coil, E, E, through which it slowly passes, and where it is either decomposed or intensely superheated. As soon as the gases from the superheated steam enter the retort, a perceptible change takes place in the appearance of the flame. The gas now burns with a very clear, hot and almost smokeless flame. In order to render the combustion still more perfect, an additional

amount of oxygen is supplied by a small air pump connected with the pipe, H, which forces the air at a steady pressure, of about half a pound to the inch, into the center of the retort, where it thoroughly mixes with the gases therein contained. The fire then burns with a clear, blue, intense flame, which is at once appreciated by all engineers and chemists. When properly at work, not a particle of smoke is produced, nor is there the least collection of carbon in the retort, arms or burners; all has undergone combustion. The quantity of steam, oil, gas and air is regulated by separate faucets, so that the fire is under complete control, and can be modified or extinguished at will. The heat evolved is intense, far exceeding, in temperature, anything which can be produced by coal or wood. The machine itself does not appear to be materially injured by the heat, while the flues of the boilers, it is thought, will last twice as long as they will with coal fires; because there is no sulphur in the oil to injure them, as is the case when coal is used. The fire can be increased or diminished, or entirely extinguished and relighted in an instant. During the whole series of two years' experiments on shore and at sea, not the slightest accident has ever occurred. The apparatus is easily managed by any man of ordinary ability.

FOOTE'S APPARATUS FOR BURNING CRUDE PETROLEUM.

ing depots which they are enabled to establish.

EXPERIMENTS IN BURNING PETROLEUM.

Ever since the discovery of petroleum, in large quantities, inventors have been active in their efforts to devise a means by which it may be substituted for coal in the generation of steam. Shaw & Lintou were the first in this country to bring prominent attention to the possibility of such a thing, and Mr. Richardson led all other experimenters in England. Since the early experiments of these gentlemen, a great number of others have undertaken the solution of the problem, all of whom have met with more or less success; but none of whom appear to have arrived at such a degree of perfection in their efforts, as have Colonel Foote, of the U. S. Navy, and Col. White, of this city. The former has been the most persistent and laborious in his experiments, and has done more than any other to demonstrate to the world the practicability and economy of the use of petroleum for making steam. Our readers have been made familiar through our own columns, and those of

nessed and examined by hundreds of our citizens—mechanics, engineers and others.

Before describing its working, however, we would call the attention of the reader to the following illustration of the device which has been engraved from a photograph of the apparatus itself. It is also similar in every respect to those which were used on board the Palos in Boston Harbor, and is the result of many hundred practical experiments, extending over a period of two years. It can be applied to any wood or coal boiler now in use, by merely removing the grate bars and placing this apparatus in their stead.

DESCRIPTION OF COL. FOOTE'S INVENTION.

A represents a cast iron retort, the bottom being of wrought iron and bolted around the edges. B is a small pipe, connected with the oil tank, and through which the crude petroleum enters the retort. Its diameter where it enters is one-eighth of an inch. C, C, C, are arms of common iron gas pipe, screwed into the sides of the retort, having on their outer ends elbows, opening upwards, into which are inserted mushroom shaped solid cast iron burners, D, D, with fluted stems. The object of these burners is to spread the flame, and as their discs are

IMPROVED CONSTRUCTION OF RETORT.

We have stated that the apparatus now in use at 417 Mission street, and illustrated herewith, was the one used in the experiments made last summer at the Battery in New York. Experience there has suggested the introduction of several important modifications in the construction of these petroleum burners. By reference to the illustration, it will be seen that the general shape of the retort is much in the form of an inverted T: thus 1. It has been found in practice, that the projection upward, from the body of the retort, is useless and inconvenient, and oftentimes removes the burners at too great a distance from the fire surface of the boilers. For these reasons the retorts now made are constructed so that in section they conform very much in shape to that of the common D retort; thus 2. The burners are made very short, and screwed directly into the upper and side walls of the retort. The coil of pipe used for superheating the steam, which is now placed directly over the retort, in that of the new construction, will be so placed as to pass around the furnace, near to the walls, thus leaving the flames to act more directly upon the fire surface of the boiler. The air and steam connections are also somewhat modified. This change in the mode of construction renders the retort more compact and less liable to injury of its parts by the intensity of its own fires. A new retort, with the above improvements and modifications, is now being made at one of the foundries in this city, which will soon be substituted for the one now in use.

CALIFORNIA PETROLEUM.

By reference again to the illustration, it will be seen that there are four burners on each side of the upright projection. The character of the Eastern petroleum required the employment of that number, and they were used at the first trial in this city. It was soon found, however, that two on each side was all that were needed—half the number required at the East. This modification is required on account of the heavy nature of the California oil, which contains such an increased amount of carbon over that obtained at the East. This peculiarity in California petroleum, while it decreases its value for the production of illuminating oils, adds greatly to its efficiency for steam fuel.

CONSIDERATIONS OF COST.

Much less value is attached to the substitution of petroleum for coal at the East than on this coast, from the fact that the relative cost of the two fuels, in proportion to the work which they are respectively able to perform, is the reverse in this State to what it is at the East. Here petroleum is cheap, and of superior quality for making steam to the Eastern product; while coal is much dearer, and, when obtained from our own mines, much poorer in quality. So great is this difference of cost, that what might be a failure at the East would be a most emphatic success here.

The anthracite coal, commonly burned by steamers on this coast, costs about \$16 a ton, and it has been estimated at the East that two barrels of Pennsylvania oil contains as much heat-producing power as a ton of anthracite. The experiments at 417 Mission street, however, have quite satisfactorily demonstrated that the greater heat-producing power of the California petroleum will here add still more, and an important percentage to the advantage of oil over coal.

CAREFUL COMPARATIVE EXPERIMENTS TO BE MADE.

So important is the question of the substitution of petroleum for coal considered here, that, we understand, the Mechanics' Institute of this city, at the suggestion of Col. Foote's agents, have determined to appoint a committee under whose especial direction a series of carefully conducted experiments will be made to definitely settle the same. Those experiments will be made with the improved apparatus now being constructed, and to which allusion has already been made.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER NINE.

EXPLANATIONS.

So far, this series has been something like what has been jocularly stated respecting the play of Hamlet, with the part of Hamlet left out; as hitherto no particular reference has been made to that method which forms the principal features of the chief caption. This apparent oversight has arisen from an omission which I did not discover until the seventh paper was undergoing revision, viz: that the title which forms the caption of these papers, only very imperfectly describes their intended scope, which was to discuss in a terse manner the various modes that have been, or are now, adopted for the reduction of gold and silver ores at different times and places, and briefly to describe their capability or incapability of adoption, more especially to the territory of this coast. It is my opinion that, taking into consideration all the circumstances associated with our present position and the general character of our ores, with those containing silver, or silver and gold, in the great bulk of cases amalgamation, somewhat analogous to the Freiberg method, will be found under existing circumstances, and for some time to come, the easiest of application, most efficient and economical.

In the preceding papers little allusion has been made to the barrel mode; as, however, roasting, and that of the same character, is common to all the modern processes that have been described, or are at all likely to be brought into actual practice, the omission is not actually of so glaring character, as may appear from a cursory inspection; especially when it is remembered that in Augustin's method of extracting silver by means of brine, either alone or supplemented in combination with chlorine, in order to effect at the same time the extraction of gold, all the prior steps have to be taken in a precisely similar manner, whether water combined with salt, or mercury, is the final agent employed to extract one or both of the precious metals from the ores.

It will hereafter be explained—and when not explained the reasons for such an opinion may, in a great degree, be gathered from the general tone and line of argument pursued—why I deem that method the most advisable under present circumstances. It is by no means wished to be inferred from the remark last made, that the method thus recommended is the one which the writer feels convinced is the best. On the contrary, he is thoroughly satisfied, and has long been so, after protracted study and many trials, that, as a general mode or modes, chemical or aqueous ones are those in which rapidity, economy and efficiency will be found to combine in the most practical manner. But here comes the important point; who is or are to introduce, or teach, the improvements just alluded to? And, when fully and practically established, where are the parties to be found capable of superintending such operations? Amalgamation, on the contrary, is so simple, whether by barrel or pan, that any sensible laboring man can, in one day's instruction, be taught what is required. If, on this coast, a really advanced and early step towards improvement in the reduction of gold and silver ores is to be made, it can only be accomplished by the institution of a metallurgic establishment on such a scale as will justify the erection of all the accessory apparatus requisite to utilize and manufacture into various pro-

ducts many of the substances comprised in such ores which are now worse than wasted, but which, on the contrary, would by this means be utilized while forming the preparatory steps for facilitating their easier and more efficient ultimate reduction.

An establishment of this character, if commenced this spring, designed by and placed under the control of a person practically acquainted with the management of extensive chemical and metallurgical works, would prove not only commercially profitable, but so enormously self-expansive, that, within three years after commencing operations, it would have obtained a world-wide reputation, both for economy and efficiency; and would be capable of turning out, within twelve months after starting, a continuous stream of well-instructed cadets, sufficiently numerous to supply practically instructed experts, not only for the growing demands of this, but of other communities.

I am afraid, however, that to most minds in California, especially those that are the most deeply engaged in mining speculations, such a result, predicted above as possible, will be deemed as constituting something like a visionary metallurgic Utopia—very desirable, but unattainable. The visionaries in this case, however, are those who deem such a state of things impossible; not those, who, like myself, know both from experience and theory that the losses now sustained of 50 per cent. on the amount of bullion benefited, may be reduced, in the greater number of cases, to below 10 per cent., and that by the introduction of very little that is now in practice and nowise new in principle, and could have been put into operation just as easily in 1860 as 1868. The parrot cry, less heard now than a few years ago, of such and such scientists having been engaged, and consulted, and accomplishing nothing, is no reply whatever to the statement just named; for I should like to be informed of the name of any one person who has been consulted on this coast who was so qualified, from an acquaintance both practical and theoretical, as to justify confidence in the soundness of his advice, or as to the probability of his being likely to introduce any serviceable improvement; or of any one, fitted for the position by the possession of such joint knowledge, having been appointed to the chief superintendence of any of the mines or metallurgic works in Nevada. If either of these circumstances has occurred, I am not acquainted with it. The evil consequence of such a state of things has long been seen by the far-sighted; and has resulted from the purblind, egotistical reliance on that kind of vigor, which, though frequently of an indiscriminating, and, consequently, often of an injurious, in place of a serviceable character, is a common characteristic of "thorough business men." Such qualifications can, however, never replace the special acquirements required on the part of a mining and metallurgic superintendent.

More than seven years ago, I publicly stated, and at the same time gave my reasons for making the statement, that men possessing these joint qualifications were so sparse that, if the world was searched, they might be enumerated, when found, on the fingers of the hand engaged in writing the sentence. More than seven years have passed since that statement was made, during which interval stockholders and the public have had the opportunity of witnessing the state of things resulting from intrusting the management of their affairs with presidents and superintendents claiming no other qualification than that of being energetic business men. How long those interested will quietly allow such serious mismanagement to continue, is only for themselves to determine. An end might at once be put to the evil, if the stockholders would only so resolve, and insist upon taking a more frequent and active interest in the management of their affairs.

AFTER-THOUGHTS.

I thought I should have ceased further digressions, and so have speedily completed this series in the order which I originally conceived. The long interpolation respecting the brine and chlorine method, which has been introduced after it was supposed by the writer that further reference thereto would not be needed, combined with a subsequent explanation which appeared to be required, placed me under the necessity of refreshing my memory on many points, by searching such authorized accounts which I possessed that related to this mode. In doing so, I became reminded of many subjects,

great and small, respecting which I had previously omitted to make allusion when detailing Augustin's and Ziervogel's methods; and for practical purposes they are highly important ones.

It has already been shown that when brine is employed for the extraction of silver, the amount of solution required is enormously large. In the searches alluded to, I was, however, very much surprised to find that by Ziervogel's method (with hot water) the quantity of liquid required was even greater; thus, according to Rivot, 216 kilograms (475 lbs.) of roasted matte by the process of Ziervogel require from four to five cubic metres (140 to 175 cubic feet) of hot water, at a temperature of 149° Fahr., in order to dissolve the sulphate of silver formed during the last roasting—or nearly double the proportionate amount of solution required when the brine method is employed.

It has already been stated, when describing the roasting operations, that whether as respects Ziervogel's or Augustin's mode, that, by a protracted roasting or exposure to too high temperature, the solubility of the resulting silver compound is very much diminished. How very greatly so in the case of sulphate of silver, as compared with the same salt when formed by the aqueous mode, may be easily understood when it is mentioned that sulphate of silver so formed, as is daily done in the refining and parting of silver from gold, is soluble in 87 parts of water. In such a case, half a ton (1000 lbs.) of hot water, if employed in leaching a ton of prepared matte or roasted ore, as the case may be, would suffice to cover such matte; and ought to be sufficient to dissolve one hundred and eighty ounces of sulphate of silver, or the equivalent of one hundred and thirty ounces of silver in the metallic state, were it not that the circumstances previously named so largely contribute towards the gradual conversion of the sulphate of silver into a very insoluble condition; as will easily be seen when it is shown that in place of 1,000 lbs. of hot water, being capable, in working operations, of leaching out one hundred and eighty ounces of sulphate of silver—worth, as metallic silver, \$220—it requires in Freiberg not less than from 85,500 to 109,375 lbs., or four to five tons, of hot water to leach out about thirty ounces of sulphate of silver, or say a little over twenty ounces of the metal, in value about \$25.

In reference, however, to the brine and chlorine method, another objectionable feature exists, one, of which, although I was aware of it previously, I had entirely overlooked the importance assumed, if the method is ever adopted on this coast.

It has already been stated that the variety of native gold and silver alloy called electrum, which was the one most adopted for the employment of chlorine, in conjunction with brine, was found more generally in Hungary and Transylvania—possibly found also in Bohemia—in all which countries salt is obtainable in great abundance and at a low price; probably as low as at the salt works in England, where it only obtains about \$1.50 per ton. Under such circumstances, the loss of four or five tons per day would not form a very serious item of expense; where, however, it costs twenty dollars, and in many cases a great deal more, the inevitable waste of any considerable proportionate quantity would be found an important matter—as will be seen by perusing the following quotation from Rivot's summing up of the general result of the lixiviating process of Augustin:

"In order to treat, in one year of 300 working days, the 2,917 tons of mattes produced by the ores mined in 1850, twenty dissolving tubs and twenty-four precipitating tubs would be required. The different manipulations require ten workmen, under the direction of a suitable foreman. The saline solution used in one day would contain twenty-six tons of salt, and the loss of salt may be estimated at one-fifth, or less, of the quantity used, say 390 tons for the whole year."

The preceding figures would give an average of ten tons of matte per day, the average loss of salt in each ton of matte so lixiviated being, according to a more detailed statement, little over one-seventh, or 0.133 of a ton, which Rivot estimates at sixteen francs, assuming salt to be worth 120 francs per ton. At the same ratio the money loss that would be sustained by lixiviating by means of salt, which would result from the waste of the latter article, would amount to \$2.66 on every ton of roasted ore so treated, assuming salt to be worth \$20 per ton. This is independent of the salt required for the chlorinating roasting.

* Rivot sets down the total cost, 71,900 francs per annum—the loss on account of salt being more than one-half, or 46,800 francs. What would such cost be in California?

Mechanical.

Prevention of Boiler Incrustation.

Messrs. Editors:—In looking over the back numbers of your valuable paper, I found an article that set me to thinking on that interesting subject, the prevention of the deposit of earthy incrustation in marine boilers.

No amount of blowing off in the usual manner will prevent it entirely; for the reason that the moment that sea-water begins to increase in density, it begins to deposit sulphate and carbonate of lime, of which the troublesome deposits principally consist. Suppose a steamship to be furnished with surface condenser and appurtenances in the usual manner, and all of her boilers, but one, to be of the most approved patterns for generating large quantities of steam, at the required pressure; then let the other boiler be so constructed as to admit of easy access for the removal of scale or deposit, and to be capable of producing about one-sixth as much steam as all the others. This last I will call the salt water boiler, and the others the fresh water boilers—the steam pipes of all the boilers to communicate freely with each other, the water line of the salt water boiler to be at all times below that in the fresh water boilers, so that it can receive a continuous feed by gravitation, through a pipe (which I shall call the communication pipe) connecting their water spaces, and regulated by a cock at the pleasure of the engineer. All the fresh water from the condenser is forced into the fresh water boilers. As the condensers always leak, this water will be increased in quantity, and have salt in it to the amount due that leakage; and as this is the water evaporated by all the boilers, it will maintain the desired water level in all the fresh water boilers, while the surplus will pass through the communication pipe and feed the salt water boilers. Now, as this water, thus passing from the fresh to the salt water boiler, is much in excess of the salt water that gets in through leakage in the condensers, the water in the fresh water boilers will remain fresh; or if salt, become fresh, (that is, fresh as compared with sea water) and consequently make no deposit—a result which would admit of the use of boilers with less water space in proportion to the heating surface, thereby reducing their size and weight, and admitting the use of a higher pressure of steam, smaller engines, higher grade of expansion, etc.

When the water, thus fed to the salt water boiler is insufficient to maintain the desired level (which will always be the case when the condenser is tight), water must be forced in from the sea; when it becomes too salt, it must be blown off, etc.

Yours, theoretically, JONES.
Benicia, December, 1867.

CORROSION OF BOILERS.—An interesting paper "On the Corrosion of Locomotive Boilers, and the Means of Prevention," has been published in the proceedings of the Institution of Mechanical Engineers, England. The subject has excited attention from the frequency of boilers having exploded in the kingdom within the past year, involving a great loss of life and property. It is stated that the wear of a locomotive boiler is from five to eight years, during which it will have evaporated ten million gallons of water, is equivalent to thirty years' wear of a stationary boiler. Mr. Kirtly, the author of the paper referred to, points out the chemical and mechanical agencies by which the waste of the boiler plates is occasioned, and also the cause of weakness, in the change of temperature produced by the supply of cold water to the boiler, which, however, can be remedied by care in feeding. In the opinion of Mr. Kirtly, all these sources of weakness and of danger may be avoided by an improved mode of constructing boilers. It is pointed out that since the tires of wheels have been manufactured of one single piece, without joint or weld, the breaking of tires has become less frequent than before. Therefore, it is urged that if a boiler is made of one great hoop, instead of a number of plates,

it will be much less liable to explosion than one made in the ordinary way. It is stated that for six years past nineteen of these welded boilers have been in constant use on the Midland Railway in England, and with such satisfactory results that the same mode of construction has been permanently adopted for all the engines on the line. Each of the boilers has traveled 175,000 miles, and is in good condition. The cost is said to be somewhat higher than at present, but this is warranted by the great saving in after repairs and the diminution of risk.—N. Y. Mer. Journal.

The Use of Magnetism in Casting Iron.

In the course of Mr. Robinson's experiments, undertaken to prove the utility of magnetism in producing wrought iron, he records the following: A 4-inch electro-magnet, excited by one of Smee's quart batteries, and capable of sustaining an armature of thirty-five pounds, was applied to a number of sand molds in such a manner that the molten iron should, in the act of casting, be placed within the magnetic current. Similar castings were made from the same ladle full of iron without contact with the magnet.

The effects of the magnet were very distinctly visible—the castings not magnetized were of the ordinary dull grey hue, with granular surface; the fracture presented a mixture of earthy and coarse crystalline structure, very brittle and gritty to the file.

Those subjected to the action of the magnet showed contrary characteristics; and presented a bright, shining surface, very much like lead, newly cast; the fracture finely crystalline, with uniform metallic brilliancy. They yielded, under the hammer, when cold, sufficiently to bear riveting, and at a red heat bore a limited amount of forging without breakage. Under the file, the cut was more like that of brass than iron.

During and for a short time after pouring, the metal in the running holes, subjected to the influence of the battery, was in active ebullition, and when cold was found to be much honey-combed by bubbles, indicating the escape of gaseous matter from the metal.

The theory of this gaseous formation and escape is as follows: If magnetism produces malleable iron from cast iron (as it is known to do), it must be by driving off the carbon in some manner; and if driven off, it must be in a gaseous form. To render carbon gaseous, the presence of oxygen is indispensable. Now, it so happens that among the gases oxygen is para-magnetic; therefore, in the magnetic sphere, as was shown in our issue of October 5, 1867, page 211, there will be a concentration of oxygen. But this will not account for the oxidation of the carbon, unless it can be shown that the carbon is brought in contact with the oxygen. On the surface it will be brought in contact with a condensed atmosphere of oxygen; but without stirring how is the carbon, which is mixed or in combination with the metal below, to be reached? There seems to be but one way of accounting for it, viz., thus: The particles of iron being magnetic, but the particles of carbon not being so, the particles of iron are necessarily colligated together when under the action of the magnet; and the carbon squeezed out, the carbon will necessarily rise to the surface and there burn, which it apparently does, producing a great heat and intense ebullition of metal.

FITTING TIRES TO WHEELS.—Some time ago, when fitting a tire on a wheel at the Royal Arsenal, Woolwich, England, it was found necessary to give a bevel to the wheel of about three-eighths inch. One of the men suggested that the bevel could be given by heating the tire red hot and then immersing it one-half its depth in cold water. This was tried and found to answer perfectly, the part which was immersed being reduced in diameter. The tire was three inches wide, one-half inch thick, and four feet two inches diameter.

GRINDING with a cast iron wheel at high velocity, is a process successfully conducted at many shops, and which has been found to be both economical and efficient.

Scientific Miscellany.

INTERESTING AND VALUABLE DISCOVERY OF NATURAL PHOSPHATES.—Immense deposits of valuable phosphates, said to be superior to Peruvian guano, and of incalculable value, have recently been discovered on plantations hitherto considered of little worth, stretching along the banks of Ashley river, a few miles above Charleston, South Carolina. A company has been formed, backed by Northern capitalists, to utilize those deposits, which consist of animal remains, forming a thick substratum for many miles. The subject excites considerable interest there.

When the deposit was first particularly observed, the discoverers were ignorant alike of its character and value. Its peculiar characteristics were such, however, that samples were forwarded to several distinguished chemists, who soon ascertained its true nature and value. This important discovery will prove of immense benefit to both the city of Charleston and the State of South Carolina. The deposit is supposed to have resulted from an immense collection of bones and other animal matter, which has become decomposed and finally solidified, with from 30 to 50 per cent. of earthy matter, into a semi-silicious or stony substance, of about the consistency of hard clay. The deposits cover many square miles of territory, and much of it is as valuable as the best guano, which sells in the Eastern market as high as \$90 per ton.

The discovery is very interesting in a scientific, as well as in an economic point of view, and its origin will doubtless form a subject of careful investigation at an early day. It is more than probable that it may lead to important discoveries of a similar nature in other localities. With the increase of scientific agriculture, a constantly growing want is felt for earth fertilizers; the ordinary supplies of manure are entirely inadequate, even to present wants, and the supplies of guano are so limited that the period of their utter exhaustion must soon be reached. Either natural or fossiliferous phosphates must be the ultimate dependence of the agriculturist for his supply of plant food.

Modern explorations and scientific research, will undoubtedly meet the future wants of mankind in this respect, to their fullest extent. Past experience has fully established the important fact that the Creator has not been unmindful of the necessities of man, as he increases and multiplies, and gradually unfolds the wants of advanced civilization. The printing press, the steam engine, electricity and mineral fuel are important evidences in this direction. Other wants will be supplied in the same manner, as fast as they become apparent, if man only makes a proper use of the intellect which God has given him, by which to search into the complicated mysteries of His creation.

THE ZODIACAL LIGHT.—Attempts are to be made to determine the character of the Zodiacal light by means of spectrum analysis. Prof. Bayley points out the importance of a spectro-scopical examination of the sun, when totally eclipsed, for the determination of the nature and extent of its luminous atmosphere, and thinks there is much reason to believe that this atmosphere either constitutes in fact or is partially identical with the Zodiacal Light. A rare opportunity will be offered for observations of this kind at the eclipse of the sun in August next, which will be total in accessible portions of the East Indies.

RECENT experiments conducted by the French Government, show that the water-tanks on board a ship should be coated inside with tin, and not with galvanized iron, as at present. It was discovered that the water, under certain various conditions, dissolved the zinc off the iron, and rendered it injurious to health.

SINGULAR PHENOMENON.—A curious and annoying tendency is often encountered among astronomers in the telescopic disks of stars becoming triangular; at times this phenomenon appears to be most particularly apparent during an east or southeast wind. It has been satisfactorily proven that the peculiarity does not depend on the object-glass of the telescope. To what is it due? is a question often asked, but not yet satisfactorily explained. Prof. Airy, the English astronomer Royal, has intimated that the phenomenon might be due to the derangement of the nervous system, which so generally accompanies an east wind; it has also been attributed to the fatigue of the observer. Unfortunately, however, for both these theories, it is often noticed when the observer is fresh and entirely free from fatigue; and Capt. Noblo, a gentleman who rejoices in digestive powers but little inferior to those of an ostrich, and to whom nervous symptoms are as unknown as they are to a steam-engine, is quite as much troubled with "triangular disks" as the most nervous of astronomers. The question of the source of this phenomenon is still unknown; and the opinion is quite generally entertained that it is certainly independent of both the astronomer and his instrument.

COMBUSTION OF COAL.—Native bituminous coals of the best quality contain about 80 per cent. of carbon, and one pound requires 265 cubic feet of air for its combustion. Anthracite coal contains about 92 per cent. of carbon, and requires about 282 cubic feet of air for the combustion of one pound. Only the oxygen in the atmospheric air combines with the carbon of coal during combustion; the nitrogen is inert. Much of the heat of a furnace is dissipated in heating the nitrogen of the air. With oxygen alone the heat will be infinitely more intense.

The thin tubes used by artists to hold liquid colors are formed by placing a disk of block tin in a die or cylinder, into which a punch is slowly forced by hydraulic pressure or other suitable means. The punch almost exactly fits the cylinder, and the tin rises into the intervening annulus in the same way as if it were a liquid, its constituent particles being made to move on each other in much the same way as they would do if the tin were melted by heat.

The tension of liquids has recently been demonstrated by some French philosophers. A ring of thin wire dipped into a liquid—say glycerine—comes out with a film filling up the whole interior. It is shown by experiments that this film will bear some weight before bursting, and that a loop of silk thread thrown upon it will, as the film bursts, be pulled equally in all directions, and made perfectly circular by the tension of the liquid.

THE MAGNESIUM LIGHT IN A BALLOON.—Experiments have been made at Birmingham to try the effect of the magnesium light when attached to a balloon in the air. The experiments were striking in effect, the light thrown forth being very brilliant, and illuminating the streets, houses, and crowds of people with a distinctness resembling day.

When very strongly heated; soapstone, or steatite, loses a portion of its compound water; it becomes harder, and susceptible of taking a polish. It is used in this form for gas burners, for which it possesses many advantages, neither corroding nor burning out.

Sponges belong to the lowest class of animals, and may be said to form the first link in the great chain of life which culminates in man. The finest sponges are obtained from the islands of the Mediterranean; the coarser description from the Bahama banks and the coast of Florida.

FORGING BY PRESSURE.—The applications of this process are daily increasing in number, and in the generality of their employment, especially in England, as we learn from an authority thoroughly conversant with the subject. Thus the hooks and many other parts of differential pulleys are shaped, as also hammers and other similar instruments.

Weekly Stock Circular.

Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
JANUARY 13, 1895.

Money Market.

Our money market continues to be fully supplied; but is somewhat inactive, a moderate discount business being done. Cash on call loans is obtainable at 1 per cent. and at 10 per cent. for long periods on real estate collateral. Owing to the bad condition of our roads, caused by the heavy rains, Bullion is scarce and in demand. We quote Gold Bars at 900/20. Silver Bars are also in request at 1/2 premium. Currency Bills on the Atlantic cities are at 35 1/2 et. premium on Gold; Sight Drafts, payable in 10, 14 1/2 per cent.; Telegraphic Transfers, 1 1/2 @ 1 1/4; Sterling Exchange, 4 3/4; Commercial do, 4 1/2 @ 4 1/4; Exchange on Paris, 5 francs for 30 days.

The free exportation of grain, which has recommenced, and with a fair prospect of continuance, will greatly assist our financial condition. The New York canals have been closed for some time, locking up several millions of bushels of wheat, which will not be available for commerce until next spring. The upper Baltic is also closed, and no supplies may be expected from that quarter for some time to come. The grain of southern Russia is already in market, but little more can be drawn from that source. We also learn of the almost total destruction of the rice crop in Bengal and other parts of India, which cannot fail to bring our supplies of breadstuffs into requisition. The demand from England and France is undiminished, and promises to continue until the new crop comes to hand. On every hand large and remunerative markets are opening to our breadstuffs trade, and we perceive no cause to predict anything but prosperity to our agricultural classes during the current year. The handsome dividends declared by the Bank of California, and by the Savings and Loans institutions, and a number of our mining companies, and most of our Home Insurance companies, prove a very healthy financial condition.

The steamship China, which left this port for Yokohama and Hongkong on the 13th inst., carried away \$34,203 in treasure, divided as follows: to Hongkong, \$375,835, of which \$111,700 was in Gold Bars; \$29,832 in Gold Coin; \$21,000 in Gold Dust; \$35,622 in Silver Bars, and \$175,581 in Mexican Dollars. To Shanghai she took \$2,908 in Silver Bars, and to Yokohama, \$205,343, of which \$50,716 was in Silver Bars, and \$154,627 in Mexican Dollars.

The shipments of Treasure from January 1st to date have been as follows:

January 11—Per Golden City—		
To Hongkong.....	\$1,297,895 33	
To Panama.....	15,000 00	
January 13—Per China—		\$1,312,955 93
To New York.....	\$375,835 82	
To Shanghai.....	2,908 82	
To Yokohama.....	205,343 46	

Total since January 1st, 1895.....\$1,897,199 73
The receipts of Treasure at this city from all sources, (says the Commercial Herald) through regular public channels, during the past twelve months, as compared with 1894, have been as follows:

	1894.	1895.
From California, Northern Mines.....	\$22,715 340	\$40,927,309
From California, Southern Mines.....	5,149,749	4,471,461
From Coastwise Ports, Oregon, etc.....	5,949,536	6,192,734
Imports, Foreign, British Columbia, etc.....	2,887,028	3,962,222
Totals.....	\$32,692,653	\$55,566,226

From an examination of the statements of treasure received in this city, it will be seen that there has been an increase of more than \$2,000,000 in the amount received from the northern mines the past over the preceding year; the greater portion of this increment being due to the State of Nevada. The receipts from the southern mines have meantime fallen off materially, while those from coastwise ports, Oregon, etc., have increased slightly, and those from British Columbia and other foreign ports very considerably. The bullion transmitted the past year to this city, through Wells, Fargo & Co's Express, as being the product of the State of Nevada, amounted to \$18,000,000. To this sum may be added, perhaps, \$500,000 to represent the amount of bullion arriving during the year in private hands, making a total product for that State for 1894 of \$18,500,000. Of this sum about \$2,000,000 may be set down as the product of Reese River and other outside localities, leaving the balance \$6,500,000 to be credited to the Comstock lode. In apportioning the product of these several outside localities, about \$1,500,000 should be set down to account of what is usually termed the Reese River country, which, for the end in view, should be made to embrace all the adjoining districts about Austin; in fact the whole of Lander, Nye and Lincoln counties, excepting perhaps the Silver Peak district, which lies in Esmeralda County, and which has turned out but little bullion the past year. The remaining half million may be divided between Humboldt and Esmeralda counties in the following proportions: \$300,000 for the former and \$200,000 for the latter, none of the other counties in the State except Storey containing the Comstock lode, producing any bullion worth naming. These figures, as will be seen, denote for the year in question a very marked increase in the State at large over the yield of any former year; this rate of increase being in about the same ratio for the Comstock lode and the outside precincts. The product of the former for 1894, was estimated at \$16,250,000, and of the other localities named, \$1,250,000, of which \$1,000,000 was assigned to Reese River, and \$250,000 to Humboldt and Esmeralda. While, however, such gratifying gains have, during this period, signalled the progress of Nevada, the year has rather been one of preliminary preparation than of progress and fruition; the most of the companies owning what may be considered the more promising of the outside mines, having been engaged, at heavy expense, in developing their claims and erecting mills—very few of them in active productive operation. These mills will soon be completed, and the mines be thoroughly explored and placed in condition to yield ore largely; rendering it probable that still more marked additions will be made to the bullion returns of the State the present than was done the past year; and almost insuring for that State a total product for 1895 of \$20,000,000. Even if the Comstock mines should not advance their yield, or should suffer some small abatement this result will probably be attained, as there is an almost certainty of the mines at Silver Peak and those about Belmont turning out a large amount of bullion the current year, to say nothing of promised gains for Humboldt and Esmeralda.

City Stocks.

During the past week the transactions in miscellaneous stocks have been very light. Sales of Spring Valley Water Co. stock were made at \$64, and Union Insurance Co. at \$92 1/2 per share. The usual dividends of our various local corporations have been disbursed during the past fortnight. At the close, San Francisco Gas stock sold at \$65 50; fifty shares Omnibus R. R. at \$63 50, and 250 shares Fireman's Fund Ins. stock at \$88.

Through the kindness of the Secretaries of two of our city railroads, we have obtained the following statements of the past year's business:

The North Beach and Mission Railroad Company was incorporated August 23, 1862. Capital stock, \$1,000,000; receipts in 1894, \$168,984 20; dividends, \$40,000; assessments, none; assets, close of 1894, \$6,000.

The Frenet Street, Mission and Ocean Railroad Company was incorporated April 25, 1863. Capital stock, \$1,000,000. The sales in the open Board during the last quarter of 1894, said sessions having commenced some time in September, amounted to \$4,733,433, and added to the sales in the regular Board, show a grand aggregate of \$70,943,012 for the year 1894, against \$38,000,000 in 1893; \$23,000,000 in 1892, and \$45,000,000 in 1891.

Mining Share Market.

Since the incoming of the new year, mining stocks have experienced a remarkable and rather unexpected advance, amount of business in 1894, \$61,798 77; dividends, none; assessments, none.

From a carefully compiled record of the sales at the regular sessions of the San Francisco Stock and Exchange Board, we give the following interesting figures, extending over a period of three years—1893, 1894, and 1895:

MONTH.	1893.	1894.	1895.
January.....	\$1,901,538	\$2,727,187	\$3,654,322
February.....	2,381,855	3,452,282	3,303,520
March.....	5,628,801	5,299,084	4,914,285
April.....	4,339,032	4,638,096	5,293,016
May.....	5,665,549	3,652,102	7,651,855
June.....	4,711,640	2,406,341	6,861,365
July.....	4,721,185	3,553,574	6,822,200
August.....	4,292,618	1,284,452	7,538,420
September.....	4,829,501	1,788,191	6,193,854
October.....	4,000,500	1,375,117	5,470,842
November.....	4,018,906	2,538,478	4,322,930
December.....	3,777,437	3,055,679	4,814,974
Totals.....	\$49,205,819	\$24,935,893	\$60,274,571

some reaching double the price obtained within a month past, while others improved out of pure sympathy; however, the "shorts" participated rather too freely, and are now suffering from the very sharp advance of a few days ago. Throughout the past week transactions have been unusually heavy, and at the close the market moderated considerably, and prices are not nearly so high. The demand for investment shows no abatement, and in many respects the mines look more promising, hence we may anticipate an active market for some time to come.

HALE & NORCROSS—rapidly advanced to \$134 50 seller 86, on the 14th inst., declined to \$2,300, and closed yesterday at \$2,525. We are informed that the ore found on the 930 level is eighteen feet wide at the north and fourteen feet at the south end, and it is thought will mill \$40 to the ton. In drifting further west on the 930 level they reached promising quartz, which drains the 780 level. The north breast has been opened ten feet, and is said to look well.

SAVAGE—has been the most active stock on the list, rose from \$122 to \$147 50, dropped to \$112 50, and closed at \$120. The bullion yield of this mine amounted to \$139,819 50 during the month of December, being the product of 4,701 1/4 tons of ore, and leaving a profit of \$84,967 91. The average yield was \$11 24 to the ton, and the cost of milling and mining \$21. After paying the \$5 dividend, they carry over a surplus of \$68,000. During the week ending January 11th the ore product was very small, amounting to only 229 tons. At that date they had 1,149 tons on hand at the mine. This mine yielded \$3,737,100 in bullion during the year 1894, against \$1,814,879 in 1893.

CROWN POINT—was in request at an advance, rising from \$725 to \$1,000, and closing at \$900. We have information from the mine to the 13th inst. At that date, the 600 level (east) had been opened some thirty-three feet north and south, showing an average deposit of five and a half feet in width, and had averaged for several days previous \$15 per ton. Over the north winze, on the same level, in "raising" some twenty feet, they found another body of ore three feet wide, which is said to be of good quality. The "raise" of fourteen feet on the east body, 700 level, has developed nine feet of ore, which is reported to look well. The 800 feet station will soon be opened.

IMPERIAL—has been in the market at \$170 @ 176, closing at \$170. The bullion receipts of this company in December amounted to \$68,571. A dispatch of the 14th inst., states that \$10,263 in bullion, being the product of both mills, was shipped on that day to the San Francisco office.

CHOLLAR-POKOR—opened at \$195, rose to \$265, then sold at \$186, and closed at \$195. On the 9th inst., the dumps at the mine contained 2,468 tons of ore. Mail advices to the 13th inst., state that the ore at the north end of the Santa Fe third level had improved, showing a yield of \$53 per ton from sample assays, and \$54 38 from similar assays from the New Santa Fe level. The ore slip of the 12th inst., reports the shipment of 112 tons of ore on that day.

KENTUCK—rose to \$300, receded to \$280, and at the close sold at \$289. During the month of December the bullion returns amounted to \$38,296 57. A dividend of \$15 per share was paid on the 15th inst. In our annual review last week we omitted to state that this company never levied an assessment.

OVERMAN—advanced from \$86 to \$115, declined to \$77 50 and closed at \$75. The actual bullion product of this company during the month of December, from 1,210 tons of ore, was \$19,992 29. The ore at present at the dumps will yield but \$17 to the ton.

YELLOW JACKET—opened at \$668, advanced to \$740, declined to \$670, then sold at \$695, and closed at \$670. GOULD & CURRY sold as high as \$420, and closed at \$375. OPIR sold at \$70 @ 75, then at \$65, and at the close \$55 is bid. The new shaft is now 163 feet in depth.

EMPIRE—advanced to \$185, and at the close \$180 is bid. BELCHER opened at \$152 50, advanced to \$170 @ 165, and at the close \$155 was bid. SIERRA NEVADA sold to a large extent, rising from \$17 to \$30, falling again to \$17, and closing yesterday at \$20. GOLD HILL QUARTZ M. Co. was in the market at \$77 @ 80 per share.

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thank for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness:

GEORGETOWN, January 22, '97.
MESSRS. DREW & Co.—Sirs: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Letters Patent" on my application through you for an "Improved Machine for Washing Ores." It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf. Very truly yours,
A. A. WOODSIDE.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge. In our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Mining Review for 1897.

We give below a review of the Coal, Copper, Borax, Petroleum, and Quicksilver operations for the past year, in continuation from our last week's issue, copying from the Commercial Herald:

COAL.

The only Coal mines now being worked in California are those of Mt. Diablo, though there are many other slight deposits elsewhere, some of which, if opened, it is believed would prove of importance. The other localities in the State at which carboniferous signs, and in some instances very considerable bodies of low grade Coal have been met with, are at Corral Hollow, Alameda county; on Bear Creek, in the Coast Range, Colusa county; at San Benito, Monterey county; Mark West Creek, Sonoma county; near Folsom, and at several other places near the coast and in the interior. At some of these places a small amount of exploratory work has been done, but not generally enough to determine the character of the Coal seam either as to quality or permanency. During the year two of the companies owning mines and operating at Mt. Diablo have built railroads connecting their mines with tide water, whereby the transportation of Coal over that portion of the route has been greatly cheapened and facilitated. The road of the Pittsburg Company, which extends from their mine to their wharf, a distance of 5 1/2 miles, cost over \$150,000. Besides the Company owning it, the Union and Eureka Companies, when at work, send their Coal over this road. The total amount of Coal taken from the Mt. Diablo mines during the past year was 109,490 tons; of which the Black Diamond contributed 33,165 tons. Eight thousand eight hundred and ninety-nine tons also reached this market during the year from Billingsham Bay, which commands a higher price in the San Francisco market than the Mt. Diablo Coal. The latter, though an inferior article, owing to the low figure at which it can be supplied to consumers, has grown into extensive use in San Francisco as a domestic fuel.

COPPER.

The prices of copper, which one year ago having become greatly depressed, it was then expected would soon experience an advance, has, up to this time failed to do so; in consequence of which every leading mine upon this coast has been obliged to discontinue operations. For more than a year past very little copper has been extracted from any of our mines, and for the past six months almost none at all; the only lots going forward consisting of small parcels of high grade ores or a few tons of bars, the latter constituting a novel but interesting feature in our copper trade. Another cause tending to restrict the shipment of our ores to foreign markets has been the high rates of freight that have prevailed, occasioned by the large bulk of breadstuffs going forward. This cause has now been in operation for nearly two years, though there is a prospect that it will soon suffer some slight if not a material abatement. A little more than two years ago transportation hence to the principal copper markets of the world, which the most of our ores must seek as well as low as \$7 1/2 per ton, whereas it is now more than double that amount, making a difference on an average cargo of some ten thousand dollars in favor of former as against present rates of transportation. That the cupriferous resources of this coast are great, admits of no doubt. There are here an immensely of ores, of at least moderately high grade, and of easy obtainment; and we have it upon good authority that a method for reducing certain classes of even the poorer of these, has been devised by parties in this city thoroughly versed in the science and experienced in the practice of metallurgy. This plan, as we are advised, does not involve the necessity of smelting, which, it is clear, cannot be employed for reducing our low grade ores with labor and fuel at present prices. Nothing less than twelve or fifteen per cent. ore will now pay expenses of inferior carriage to this place and shipment hence to Europe. Few mines in the world will yield large quantities of ore of this high grade, certainly very few in California. But we have plenty that will turn out largely six and eight per cent. ores; of this class millions of tons can be obtained annually in this State and the adjoining Territories. These, provided they are of the right composition, as we believe a large proportion of our ores will prove to be, it is found by actual tests, can be treated by this new method with profit to both the mine owner and the metallurgist. We learn that the discoverer of this new process, Mosheim, the well known metallurgist of this city, is about to erect works here on an extended scale whereby the profitable working of eight per cent. ores at first and ultimately of six will be fully assured, the metal to be turned out in the shape of refined copper bars, within twenty-four hours from delivery of the ore. With these promises realized a new impetus will be given to copper mining on this coast, and a very decided value imparted to thousands of cupriferous lodes now practically worthless.

BORAX.

The quantity of this salt manufactured in this State the past year amounted to about 500 tons, being extracted at Borax Lake, where the crude article exists in great abundance. It costs, refined and delivered in San Francisco, \$90 per ton; usual market value here, about \$280 per ton. As but little borax is required for consumption in this State, the most of it is shipped abroad.

PETROLEUM.

Several years ago quite a number of parties engaged in the business of boring for oil in different parts of this State. Many shafts and tunnels were also excavated for the same purpose; the latter being undertaken, as a general thing, at points where there was already a surface flow of oil, were all more or less successful; but none of the borings, though carried in one instance to a depth of more than 1,300 feet, and in many to three or four hundred, succeeded in obtaining anything more than a seepage of oil. In consequence of this ill luck they have all since been abandoned. Fortunately, however, there is an abundance of crude petroleum to be had in California without the trouble and expense of boring for it. From thousands of springs it is found issuing in such quantities as render it probable that the price of the manufactured article will always remain low in this country. Owing to the importation of large quantities of this oil from the East, the refineries started in this city two or three years ago have been obliged to cease operations, and there has been little or no oil made here for the past year or more. It is thought, however, that they will be able to resume the manufacture should prices advance to any appreciable extent.

QUICKSILVER.

With the opening of new mines and the extension of those already opened, the capacity for the production of this metal in California is being rapidly enlarged. In fact, enough could easily be turned out here to supply the requirements of the whole world without severely taxing the energies of the mines now being worked or in course of development.

In fact, it is the question of a market rather than the supply of ore that most concerns the owners of these properties; and since this is an article of limited use, being restricted to a few specific purposes, the consumption is not, like many other commodities, greatly affected by the price. With the extension of mining operations and the arts of civilized life there must, of course, be a corresponding increase in the demand for this metal, yet these are slow and inconsiderable compared with the rapid increase in the power for producing it that is going on in this State. The New Alameda mine, which has now been worked nearly eighteen years, with a steady increase of productive power, when worked to its full capacity, is still turning out at the rate of over 30,000 flasks annually, the ore deposits being abundant, with large reserves extracted and retained for reduction when the demand may call for it. The total yield of this mine since it was first opened approximates half a million flasks, worth, at the lowest calculation, twenty millions of dollars. This Company has a capital of \$10,000,000, employ a force of about 1,200 hands, and are subject to an average yearly expenditure of over \$700,000. About one year ago the Company made large additions to their reduction works, increasing their capacity and introducing many valuable improvements, whereby they have been enabled to treat with profit a lower grade ore than before. The New Idria mine, situated on the easterly slope of the Coast Range, in the western part of Fresno county, after having been restrained from being worked for several years through legal proceedings, resumed operations over a year ago, since which time it has been worked vigorously, and with success, nearly 300 hands having been employed, and the ore yielding about the same per cent. of metal as that from the New Alameda mine. About 12,000 flasks of quicksilver are turned out at this mine annually, and the ore deposits are represented as looking extremely favorable. At the Chapman or San Juan Bautista mine, recently opened on Chapman's Ranch, three and a half miles south of San José, furnaces have been erected capable of reducing 17,000 pounds of quicksilver per month. About one thousand tons of ore have been raised, which yields at the rate of ten per cent. of metal, and the deposit in the mine appears to be large. This mine is turning out about three hundred flasks of metal per month, a rate of production that it is thought can be kept up and perhaps largely increased. The Redington mine, situated in Lake county, about fifty miles north of Suisun City, employs two hundred men, and is turning out about one thousand flasks of quicksilver monthly. Extensive improvements have been made at this place, and it is considered a valuable property, as the deposits are extensive and the ore of fair grade, while the facilities for insuring economical reduction are many. In Pope Valley, Napa county, a valuable deposit of quicksilver has been developed within the past year. Quite recently furnaces having a capacity for reducing eight tons a day, with other works, have been erected at this place, all of which, should first trials warrant, will be largely added to the ensuing spring.

VINES AND TREES FOR JAPAN.—Our readers will recollect that we have spoken of Mr. H. D. Dunn's intention to send to Japan, an assortment of fruit trees, &c., in exchange for a like collection of Japanese products, to be received and introduced in this country. By the steamer China, which sailed on Monday last, he shipped to Yokohama 1,332 trees, 165 bushes, 3,500 plants, and 19,000 grape cuttings. Of these there were 460 apple, comprising the best varieties, 12 nectarine, 20 apricot, 250 pear, 80 cherry, 180 peach, 180 plum, 80 almond, 40 quince and 40 fig trees. The bushes were 25 current, 40 gooseberry, 50 raspberry and 50 blackberry. The amount sent is sufficient to form three fair-sized orchards and vineyards, and if they arrive in Japan in good order, they will ere many years probably be found in all portions of that country. The trees, plants, etc., in exchange, are expected to arrive by the Great Republic or China, and as they are to be sent on behalf of the Japanese Government by Matsmoto Judoyn, the late Commissioner, who is now Superintendent of Agriculture, they will probably embrace most, if not all, the valuable varieties known in Japan. Their arrival in good order will form quite an orn in fruit cultivation in this State, as they will no doubt prove a very valuable addition, which will become of greater importance when railway communication is had with the Atlantic States.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

Mechanics' Mill Association.—San Francisco. Jan. 11th. Capital stock, \$40,000; 100 shares, \$400 each. Trustees: A. W. Jee, W. B. Cantrell, R. Jesse, M. Russell and J. Kendall.

UNITED WORKMEN BOOT AND SHOE MANUFACTURING CO.—Jan. 13th. Capital stock, \$50,000; 1,000 shares, of \$50 each. Officers and Trustees: President, J. A. Mahoney; Vice President, S. J. Cunningham; Treasurer, Daniel McCarthy; Secretary, William G. Buchanan.

Boston Mill Co.—Jan. 15th. Capital stock, \$105,000; 2,100 shares, \$50 each. Trustees: J. Heald, Andrew Moon, J. J. Hucks, J. B. Snyder and J. E. Klense.

ELECTION OF OFFICERS.—The following were elected officers of the San Francisco Stock Exchange Board on Jan. 14th, for the ensuing year. President, J. B. E. Cavalier; Vice President and Caller, Geo. W. Smiley; Secretary, Franklin Lawton; Treasurer, Henry Schmiedell.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, Dec. 28th: We have before us the bullion resulting from the recent working of 16 tons of first and second class Tarshish ore at the Silver Creek mill. There are 68 bars, weighing all the way from 41 pounds down to one pound each; total weight, 1,749.60 ozs.; total value, \$2,040.20; value per ton of the ore by assay, \$147.17; result per ton by working, \$127.57, being 86½ per cent. of assay value.

Jan. 4th: Work on the Tarshish has been suspended on account of bad air. The rock continues to improve as they go down.

It is reported that good ore has been found in the Wide West lode of the Pittsburg Co.

This week, Mr. Chalmers sent to London a box of rock and ores from this district.

Amador County.

Ledger, Jan. 11th: A vein of fine rock has been struck in the Tubbs mine at the depth of 160 ft., which has been assayed by different parties and found to be valuable.

The Amador Co. have declared a dividend of \$6 per share, equal to \$22,200 in the aggregate.

Calaveras County.

Chronicle, Jan. 11th: Staples & Co. in old Rich Gulch have their mill nearly completed.

Seventy-eight tons of quartz recently crushed at Hepburn & Co's mill at Railroad Flat paid over \$20 per ton.

San Andreas *Register*, Jan. 11th: Sixty tons of second grade ore recently crushed from the Petticoat mine at Railroad Flat yielded \$30 per ton. Thirty-nine tons from Thomson & Co's claim paid \$9 per ton. Seventy-eight tons from Weihe & Sundermeyer's lead yielded \$22 per ton. Grant & Paul's ore, from their mine near Grant's Ranch, yielded \$7.50 per ton. The New York Co. have out about 40 tons that prospects \$40 per ton. Clark is piping away on his hydraulic claim.

B. K. Thorn has discovered some exceedingly rich quartz near town. Several claims have already been located. The rock resembles the fine pay ore of Amador County.

The West Point correspondent writes: Mr. Norman Harris, of San Francisco has located a large section of gravel mining ground on the ridge above Sandy Gulch, and designs working it by hydraulic process.

Lake County.

The Clear Lake *Courier* says: We learn from reliable authority that rich gold mines have recently been discovered about 30 miles north of this place, not far from the silver lode discovered a short time ago.

Mariposa County.

Mail, Jan. 4th: At an annual meeting of the stockholders of the Mariposa and Merced South Fork Canal Co., lately held in this place, the Trustees were authorized to employ labor and money for the purpose of re-opening the trail and clearing away the brush on the line of the original survey.

Heavy damagee were sustained by the Crown Lead during the flood. Their buildings, storehouse, blacksmith shop, and the house covering the quartz mill, were all swept away. The damage will be promptly repaired, and operations will be resumed in the spring.

Nevada County.

Gazette, Jan. 14th: Mining has been nearly suspended at Eureka on account of the stormy weather. The Black & Young mill is the only one running in the district. This mill will probably be kept in operation all winter. The Birchville Co. recently lost their tunnel by a cave, the damage being so great that they have abandoned it and let a contract for running a new tunnel. The Commercial Co. will not be likely to start their mill again until spring, as they have no rock out, and are not fully prepared for winter work.

Transcript, Jan. 8th: The Belcher Co. have levied an assessment of \$15 per share, delinquent on and after Jan. 27th.

Jan. 12th: Workmen were yesterday engaged in repairing the break made in the Rough and Ready Ditch, above Palmer's mill, by the late storm.

Grass Valley *Union*, Jan. 7th: At Graniteville matters are rather dull, owing to the snow and the winter season. The Birchville Co. made the banner clean-up. After a 4½ days' run they cleaned up \$2,377, their rock paying \$54 per ton. They have recently let a contract to run a tunnel 600 ft. in length, which will strike a point where the lode will have backs to the depth of 125 ft.

Black & Young are running their mill on some very fine rock, and will run the greater part of the winter. They have one of the finest mills in the district.

The Commercial, owned by Valentine, of San Francisco, has stopped for the winter, but will resume in the spring. The mill is a fine one of 10 stamps, and has two of Hendy's concentrators and one Wheeler pan.

Messrs. Clark & Pasquillon have just finished a 10-stamp mill, to be run by water power, and they will commence crushing some 200 tons of rock for Mr. Sweet, of Nevada City. The appearance of the rock denotes a rich clean-up. After Mr. Sweet's rock is disposed of, Clark & Pasquillon will crush rock from their own ledge, the "Maggie Jane."

The "Jim Ledge" will be worked as soon as some business matters are arranged—the company owning it having been recently incorporated. Numerous tunnels are being run for the proper development of the mine.

The Nebraska claim at Empire Flat, Bridgeport Township, was recently sold to H. Pauline, S. Coleman and D. Crittenden for the sum of \$20,000. The purchasers intend to erect a 10-stamp mill in a short time for the purpose of reducing the cement.

Placer County.

Herald, Jan. 11th: McCarty has sned McGonigle, of the famous Green Emigrant mine, for \$50,000. The suit grew out of financial complications connected with the mine.

Plumas County.

Quincy National, Jan. 4th: Hardscrabble is the name given to the new mining camp at Mohawk Valley. About 20 claims have been located at that place. The claims all prospect well, and the new mining camp bids fair to be one of the most prosperous in the county.

Sol. Bahb, of Mohawk Valley, was the fortunate discoverer of a chunk of solid gold, weighing 11½ ozs., which he picked up in the new claims near his ranch, about 10 days ago.

Sacramento County.

Folsom Telegraph, Jan. 11th: The ditch of the Natoma Water and Mining Co. was considerably injured by the late storm, several flumes being blown down and washed away on the line.

Sierra County.

The La Porte correspondent writes: The late snow storm has done some damage about La Porte in the way of blowing down flumes, breaking ditches, washing out water-pipes, etc. All of which is more than compensated for, by the abundant supply of water which has set all the miners at work.

Downville *Messenger*, Jan. 11th: The Howland Flat correspondent writes that the storm was very severe at that place. Dams and reservoirs in the creeks were swept away like paper castles in a gale of wind. Flumes, dumps and fixtures of mining companies were entirely swept away where in the least exposed. The Union Co. had its large timber house entirely unroofed, a second one partly, and waste track covering demolished. The Monumental Co. lost its reservoir and considerable flume, besides suffering some, but not very great damage to buildings.

Mining presents nothing new. The Union Co. is driving business at rather a brisker rate than usual, owing to the plentifulness of water for hoisting and washing purposes. The Down East, Shirley and Lone Star Cos. are doing reasonably well. The Monumental Co., by a mishap, was compelled to run 700 ft. of new tunnel to get around a piece of its tunnel that began caving and settling, which was caused by water breaking in overhead, following the tunnel back and settling it. The workmen are progressing rapidly, and expect to strike the tunnel above in March next. Good progress is being made in the El Dorado tunnel.

Sierrita County.

Eureka Union, Dec. 28th: J. H. V. Barry, of Humboldt, informs us that he has run a tunnel in on a spur of his quartz ledge on Punch Creek till he has finally struck the main ledge. The ledge is about two feet thick, and exhibits rock of very fine quality. He has heretofore crushed from this ledge some very rich rock, and he feels confident that it will prove exceedingly valuable.

ARIZONA.

Miner, Dec. 14th: Messrs. England & Bridges have lately struck a gulch about four miles from Prescott, that promises well. When it became known, quite a rush was made for the diggings. About 20 men are at work making from \$4 to \$8 per day. The gold is coarse, and pieces have been found weighing \$4. Various parties are making rockers and getting ready to work their claims.

The ore in the Chase lode is as good, if not better than ever.

The placer miners on the Hassayampa are making from \$20 to \$30 per week.

Rock in the Dividend and Galena ledges in Big Bug district is looking well.

Dr. Moeller is having an arastra built at

Walker's Camp on Lynx Creek, with which to test some of the lodes owned by him.

COLORADO.

Georgetown Miner, Dec. 19th: Garrett, Martine & Co. have made improvements lately in their works, and they are now running nicely. C. J. Goss has struck a vein of rich argentiferous galena in the Lilly lode, that assays \$3,600 silver per ton. Garrett, Martine & Co. have shipped since our last report, 2,204.50 ozs. of silver bullion. A recent test of 50 lbs. of ore from the Elijah Hiso lode, gave a result of \$233.43 silver per ton. The Nuckolls lode is looking well. Work on the W. H. White lode is actively carried on. The vein of sulphuret ore in the bottom of the shaft is now 10 or 12 in. wide.

Dec. 26th: Garrett, Martine & Co. report shipments during the week of 3,621.20 ozs. of silver bullion. Prof. Dibbin has taken a piece of silver hulsion from the Stevens lode, East Argentine, weighing 288.20 ozs., valued at \$389.07. A 3-ft. vein of fine iron sulphurets has been struck in the Albro lode, Morris district. A lot of ore from the Lilly lode, recently reduced, yielded bullion to the amount of 248.40 ozs., valued at \$335.35. The Munsell lode, a recent discovery on Leavenworth Mountain, is yielding some fine specimens of argentiferous galena. We recently saw a piece of silver bullion, extracted from 30 lbs. of ore from the Comot lode on Griffith Mountain, the yield of which was at the rate of \$455 silver per ton.

Denver *News*, Dec. 19th: The Herkimer lode is improving finely, the vein is now showing six ft. of fine quartz. Ore from the Blacktail, a recent discovery near Lee Hill, assays \$1,200 per ton. We were shown four bars of hulsion at the mint this morning, weighing 245.03 ozs., valued at \$4418.74. A fine bar of bullion can be seen at the First National Bank, weighing 152.08 ozs., valued at \$2,756. The First National Bank received two retorts of gold this morning from Central, one weighing 155 ozs., and valued at \$3,000; the other weighing 25 ozs., valued at \$250. Yesterday we saw at the First National Bank four bars of bullion, weighing 277.93 ozs., valued at \$5,798.33, also a quantity of dust, weighing 160 ozs., valued at \$2,880.

DACOTAH.

Reese River Reveille, Dec. 24th: A letter recently received in this city from South Pass City, says that a new ledge had been struck in the South Pass mines, that far surpasses everything else in the district. It is said to be large and rich, and is called the Lone Star of the State. Besides this discovery it is reported that parties have found placer diggings towards Wind river, about 30 miles from South Pass.

Virginia *Enterprise*, Jan. 14th: A private letter just received from the Sweetwater mines gives the following: There are discoveries being made every day, and such as will throw everything in the shade that has been found in the last seven years. It is hard to believe, but it is so. They have enough in sight to run two or three such mills as the Gould & Curry for years, and of that character that men are now making from \$5 to \$10 per day pounding it out in common iron mortars. They have also discovered placer mines that will pay well and give employment to 20,000 men, and are still finding more.

Silver Bend *Reporter*, Jan. 4th: We extract the following from a letter recently received from South Pass City: When I first arrived here there were but a very few cabins and the diggings limited; now we have quite a town, and every day there are new discoveries of quartz and placers. I must say this is the richest camp I was ever in. The quartz is rich, and there are any quantity of ledges—generally gold-bearing. To be honest, I think the placer diggings are limited, although I know that there are four gulches close to town that will pay big in the spring at soon as water will run in the ditches.

Salt Lake *Telegraph*, Dec. 19th: John Y. Groen has just returned from the Sweetwater mines. He says there are about 600 men there, who have erected 100 log cabins. Placer diggings have been discovered which yield good returns, and the prospects are very favorable for lively times, and general prosperity in the coming spring.

IDAHO.

Lewiston *Journal*, Dec. 21st: The Williams & Maxwell mill has made a clean up from 10 tons of the rock from the Winfield Scott lode; they saved over \$3,000 in gold—some was lost. Three bars were received by Godfrid Gamble, weighing 80 ozs., by Hunt & Hart's express, and can be seen at the California Brewery. The bars are unassayed, but will yield over \$12 to the ounce.

The Hic Jacet mill has started up. The

machinery moves readily, steadily, and with rapid motion.

The Lewiston correspondent writes: The Amador Co. have to open their tunnel during winter, so as to work with better grade. The Elk City Co. also, are running a tunnel. They have to run only about 50 feet further. The Nez Perce Hill Company have widened their ditch, and got all things ready for spring. Witt & Son are pushing their work for another year.

Improvements are going on also, at Clearwater Station. The Pioneer and Lantiam Cos. are pushing their ditch through, and will tap Crooked river by March.

MONTANA.

Post, Dec. 28th: Last summer some parties discovered rich quartz croppings on the north side of Quartz Gulch, and after prospecting some time without finding the lode, were about to give up the search, when, by the aid of Jack Thompson, the discoverer of Esmeralda, they were enabled in less than ten days to lay open one of the richest lodes in this vicinity. It has been named the "Mexicano." The discoverers are vigorously at work, and contemplate erecting a mill in the spring.

The East Bannack Co. will shortly commence operations on property in Nelson Gulch. Work will also be commenced on the Shober lead, and it will be thoroughly tested.

The Golden State Co's mill in Brown's Gulch has been closed, the engine having been found insufficient to propel the machinery.

The Leesburgh correspondent writes: The discovery of the Silver Star lead, 35 miles southwest of this place, has caused considerable excitement. About 25 lbs. of the rock have been brought to town, and by assay of L. D. Pettit, yields a paying prospect of both gold and silver.

Another quartz ledge has been discovered lately not far from here, which is said to be very rich in gold. Its locality is only known to a few.

NEVADA.

Esmeralda Enterprise, Jan. 12th: W. H. Bourne, Supt. of the Midas mine, recently brought in 786 ozs. of gold bullion, worth \$17.50 per oz., amounting to over \$13,000, being the yield of 147 tons of ore from the Midas mine, crushed at the Pioneer mill. Of the 147 tons of ore crushed, 60 tons were first class ore, estimated at \$150 per ton, and 87 tons second class, estimated at \$60 per ton. The ore was taken from the depth of 100 ft. The tunnel is now in 750 ft., and will be extended 200 ft. further. It has already cut several veins of ore assaying from \$50 to \$170 per ton. The ores are of a sulphuret or pyritous character, but also show much free gold. The average yield of the last crushing was \$90 per ton.

There are about 200 tons of ore out at the Wheeler mine, which will pay from \$40 to \$50 per ton. The Pioneer mill is at work upon it, and by the time it is reduced 400 tons more of the same sort will be ready.

The Wilson mine is looking better than ever. They have 1,000 tons of ore out that will pay \$50 per ton. They are having ore crushed at the arastra mill of Ex-Lieut. Gov. Crossman; it yields \$50 per ton. Wilson's 10-stamp mill is about ready to start upon ore from the Wilson mine.

Enterprise, Jan. 14th: The huge gold brick from the Midas claim, Pine Grove, molded from the bullion brought in last Saturday by Mr. Bourne, the superintendent, was yesterday on exhibition at the Bank of California, and attracted much attention. It weighs 777½ ozs., is \$41.5 fine, and is worth \$13,524.84. It is the most valuable brick ever molded in this State. The company expect to bring in many more like it, as their mine is looking better than ever before in its history.

RESE RIVER.

Reveille, Dec. 27th: Last week 15 tons and 300 lbs. of the best ore from the Superior ledge, worked at the small 5-stamp mill on the ground, yielded a bar of gold, worth \$144.95. Mr. Slauson brought samples of the blanketing and tailings into the city, and had them assayed at the office of Boalt & Stetefeldt; the blanketings gave \$163.29 in gold and \$18.07 in silver, making a total of \$181.36 per ton; and the tailings \$52.75 in gold and \$7.86 in silver, a total of \$60.61 per ton. The ore is pronounced to be of very simple combination, and may be reduced easily by the proper means.

Dec. 28th: On the 23d, 3,000 ozs. of crude bullion were received at Austin from Coover's Bunker Hill mill.

Dec. 30th: Two bars of bullion from the mill of the Belmont Co. arrived by the stage on Saturday.

Yesterday 2,600 ozs. of crude bullion were brought into the city from Rigby's mill, San Antonio district.

Dec. 31st: John M. Reid and Daniel Blakely have discovered a rich ledge west

of Hot Creek. From an average lot of rock from the ledge, they obtained an assay of \$221, but many specimens would have gone up into the thousands. The ore is almost exactly like that taken from the Highbridge ledge. Five ox teams left here on the 10th with 16 tons of ore for reduction at the Old Dominion Co's mill at Hot Creek. A portion of the ore is from the Sweetstakes ledge, and is expected to yield \$900 per ton.

A handsome strike of good ore has just been made in the Old Dominion Co's Merriam mine at Hot Creek. At the point where the fine ore was developed the casings of the vein are said to be thoroughly defined, and the vein matter is broad and compact.

Jan. 21: The total shipment of bullion by the Manhattan Co. during the past year was \$553,368. The company have \$20,000 on hand awaiting opportunity for shipment.

During the month of December, Wells, Fargo & Co. shipped from this city 11,103 lbs. of bullion, valued at \$170,266.35.

Jan. 6th: The mines of the Silver Peak and Gold Mountain Co., in Silver Peak district, are producing a fine quality of ore. Some 2,500 tons are now ready for the mill.

Jan. 7th: Three and three-quarters tons of ore from the Silver Champion mine in Silver Bend district, which were hauled to this city and reduced at the California mill, yielded at the rate of \$302.04 per ton. It shows a well-defined ledge three feet thick, from which two men are taking out from three to four tons a week.

Some 8,000 ozs. of bullion arrived in town this morning from the mill of the Centenary Co., Newark district, and were taken to the assay office of the Manhattan mill for melting and assay.

During the week ending Saturday, 4th instant, there were received at the assay office of the Manhattan mill 34,264 ozs. of crude bullion for melting and assay.

Lane & Fuller propose to let a contract for sinking 300 ft. in the shaft of the Lane & Fuller mine on Lander Hill.

Silver Bend Reporter, Jan. 4th: The new 40-stamp mill of the Combination Co. is rapidly approaching completion, and will be in motion by the 15th inst. Several hundred tons of ore have already been delivered at the battery, and is now arriving there at the rate of about 40 tons daily.

The Belmont Co's works upon the Transylvania have developed a splendid body of ore from the bottom of the incline north as far as the gallery extends. This is at the water line, and has been driven for a distance of 50 ft. The body of ore throughout this extent is found to be 15 ft. thick, and now supplies the 10-stamp mill of the company. It requires but little assorting. A winze is now in progress for connecting the first and second levels.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, Jan. 11th: It is reported that the workmen on the 930-foot level in the Hale & Norcross, have struck the vein, and were getting out very rich rock. The report has created quite a sensation.

Jan. 12th: From the best information we can obtain, the body of ore disclosed in the Hale & Norcross mine, is at least 10 ft. wide, which has been developed with encouraging prospect in every direction.

Jan. 14th: A letter has been received in this city stating that diggings have been found on Queen's river, near where Colonel McDermitt was killed, which prospect as high as \$120 to the pan.

A mortar for the Rhode Island mill, of the great weight of 5,700 pounds, was cast last Saturday at the Nevada Foundry, Silver City.

The Lady Bryan mine is still yielding large quantities of ore, which is being worked at a mill near the mine, with very good results.

NEW MEXICO.

A correspondent of the Denver News of Dec. 25th, writing from Elizabethtown, says: Sluicing is nearly abandoned in consequence of freezing weather. Prospecting is carried on to a considerable extent, claims are being put in shape for the coming spring. Very little money is being taken out at present. A great many miners are leaving for Taos, Moro and other towns to seek better winter quarters, but we keep the number good by new arrivals nearly every day, who strike forth with pick, pan and shovel to satisfy themselves as to the quality of our mines. It is the opinion of miners who have been prospecting the past season, that this is not a second California, but they are confident that good pay can be obtained. Humboldt, Michigan, Grönse and Willow Gulches, Spanish Bar, and a number of other discoveries, promise good returns.

OREGON.

The Boise Democrat says that new diggings have been struck on Pino Creek, Oregon, 120 miles from Willow Creek.

Humboldt Register, Dec. 21st: Quite an excitement has been created at the military posts in Southern Oregon on account of rich discoveries of gold, reported to have been found on the Mulhenn river. The excitement is so great that the soldiers are with difficulty prevented from going off en masse.

Our Home Industries.

Under this head, the Commercial Herald gives a very interesting resumé of the present condition of the various industrial interests of the State, outside of mining. After giving quite a detailed report of what our woolen mills are doing, that paper closes its remarks under that head as follows:

The establishment of woolen mills has been of immense benefit to our wool growers, as well as to the community at large, whom they have supplied with many necessities of clothing. Until these mills commenced running the entire clip of both Oregon and California were at the mercy of a monopoly of wool buyers purchasing on speculation for the Atlantic States. The demand for local manufactures broke up this monopoly, and through active competition for desirable clips raised the prices of all kinds of wool fully three cents per pound. The increased value thus obtained by wool growers will be seen when we state that upwards of 8,000,000 pounds were marketed in San Francisco in 1868, of which the local mills (Pioneer and Mission) purchased about 2,200,000 pounds, the exports for the same year being about 4,700,000 pounds. The total clips of 1867 marketed in San Francisco were in round numbers about 11,000,000 pounds, of which the mills in this city purchased about 3,000,000 pounds; 7,000,000 pounds were exported, and the balance remains on storage. The total value of the wool marketed in San Francisco during 1867 is estimated in round numbers at \$1,900,000, while there are still considerable quantities (amounts not known) held by wool growers on their ranches in the interior of the State. The actual number of sheep in California is a matter of estimate only, no definite returns having been made to any responsible party. It is believed by parties interested in the business, and who have had opportunities to judge, that at the commencement of this year there were fully 2,200,000 sheep in California, and that, unless certain contingencies excepted, the clips of wool for 1868 will exceed 17,000,000 pounds.

The other industries are summed up as follows:

DRIED AND WET FRUITS.

California is pre-eminently the fruit-growing State of the Union, there being produced within her borders not only the fruits of the temperate, but also many of the torrid zone. For size and quality of apples, pears, peaches, plums, etc., she has no rival in the States east of the Sierra Nevada, while the orange, lime, citron, fig, pomegranate, and olive and almond, and Madera nut flourish as if in their native clime. In the former named fruits, such as the apple and others, Oregon is the pioneer producer on the Pacific coast, the quantity and quality of such being both large and excellent. Possessing a similar climate to many of the Atlantic States with considerable frost in winter and rain in summer, her fruits are produced at the same seasons, and possess the same qualities for keeping. In California, on the contrary, the long continued heat and dryness of summer seems to hasten the maturing of fruit, those varieties of apples, pears, etc., termed autumn fruits, ripening in September, and winter fruits in October and November, with quite poor keeping qualities. For flavor and size, however, these fruits are equal or superior to those of Oregon, while for extent of culture they far exceed here, the largest orchards in the Union being in California. The most extensive orchard is that of Briggs & Haskell, at Marysville, which consists of one hundred and sixty acres, all planted with the best varieties of trees known. The Surveyor General's report, made from County Assessors' returns for 1868, gives the following figures regarding fruit trees in the State, viz: Apple, 1,694,986; pear, 482,477; peach, 1,083,023; plum, 234,280; lemon, 3,029; orange, 11,284; almonds, 28,640; Madera nuts, 17,271; olives, 11,881. For so young a State as California, and with so sparse a population (estimated at 470,507), the above figures regarding fruit growing are certainly most remarkable. At the present time the fruit product both green and dried, is far in advance of domestic consumption. Among others, the firm above referred to put up in 1867 rising fifty tons dried fruit, a portion of which has been sent by steamer via the Isthmus to New York seeking a market. The result of this shipment, as well as that of some grapes, has not been received by the shippers, but they feel encouraged enough to make further ventures to the same market. At present fully half the crop of green fruits is allowed to perish by rotting in the orchard for lack of consumers, which will probably be rectified as soon as a profitable export market for dried fruits can be found. One of the advantages fruit growers in California have is the early and profuse bearing of trees, both of which are unprecedented in the other States. All the varieties of figs known to commerce are produced in California, although none but the native blue fruit up to date have been successfully dried. The increase in the quality of figs produced will undoubtedly cause experiments to be made in curing them, some of which will probably be successful, and thereby increase the cultivation of the fruit. Quite a number of varieties of prunes have been cured in California, the fruit being of good quality. Raisins have been made in various portions of the State, the best being those made by B. N. Bugbey, Polson. The principal variety of grape used for the purpose by him was the Piller Zagon, which made excellent raisins, although of quite small size, as compared with those imported from Malaga. During 1867 Mr. Bugbey used the Malaga Muscatella, a much larger grape, which made a large-sized, fine-looking raisin, resembling to some extent the imported fruit. The curing of raisins is a somewhat hazardous business, requiring the use of drying houses to protect the fruit from light showers of rain which sometimes happen in September and damage the fruit. From two slight showers in August and September, 1867, the above named party had about eighteen hundred boxes raisins injured, so that they had to be made into wine to avoid total loss. Considerable quantities of raisins of inferior quality have been made in some portions of the State from the White Muscat and Sweet Water Grapes, as well as

the common or Los Angeles grape, which latter makes a plump, but tough inferior fruit. Citron is to be had in abundance in the southern counties of California. Although the fruit is of large size and flavor, none of the experiments in curing it of a quality to compete with the imported article have been successful. At present the larger portion of the crop is not gathered but allowed to rot. Zante or black currant have within the last two years been produced by J. M. Billings, at his vineyard near San José. The quantity made was in both cases quite small, but the feasibility of growing and curing currants in the State has been successfully determined. The quality of those made is unexceptionable in flavor and appearance, and considerable interest is being shown in extending the culture of the fruits. The olive was first introduced into California by the Spanish priests soon after their settlement in the State. The fruit thrives in all the valley counties, but is more extensively cultivated in Santa Barbara and Los Angeles counties. Of late considerable interest has been shown in propagating the tree, large numbers having been planted in the middle and northern counties of the State. In nut fruits there are only two varieties indigenous to the State, viz: a species of black walnut found on the lower Sacramento river and Walnut creek, near Mount Diablo, and the common hazel nut. The Madera nut had, however, been introduced into the south part of the State some thirty years ago, and being a profitable fruit to cultivate, has spread into most of the valley counties. The papershell, langueloe, soft shell and Marcellis almonds, are being planted in quite large numbers throughout California, a considerable quantity of the fruit having been marketed for the last four years. The fruit is of excellent quality and the tree a good bearer. The common chestnut of the Atlantic States has been grown to a very limited extent in El Dorado county, and the Japanese variety of the same fruit in Calaveras county. The quantity of each is however very limited, and will continue so for many years. Peanuts are grown quite extensively, the crop in 1866 being one hundred and fifty tons, Yolo county producing nearly half that amount. The bottom lands along the Sacramento river are well adapted to the cultivation of this fruit which, in good seasons, averages from one hundred and fifty to two hundred bushels per acre.

HOPS.

The cultivation of this article promises to become one of the leading agricultural industries of California. The long dry summers and fertile soil insures crops with certainty and large yield. The business, although in its infancy, is being engaged in by many counties, the vine being found very productive and the hops of good quality. The total crop of 1866 was 700,912 pounds, of which thirty-six acres in Sacramento county produced 8,300 pounds. The crop of 1867 is not yet definitely ascertained, but good judges estimate it at fully 400,000 pounds, or over half the domestic consumption on the Pacific coast. Sacramento county is probably the largest hop growing county, the product in 1867 being over 150,000 pounds. Yuba, Placer and Los Angeles counties also produced large quantities, only a portion of which have yet been marketed. The climate of the State is said to be unsurpassed in the Union for their successful production, there being no strong south or east winds experienced, nor heavy rain storm during the summer. The first of these, in the Atlantic States and Europe, often seriously affects the crop; the plants receiving much injury from being prostrated by the wind, while the rain produces mildew, blight and parasitical insects to such extent as often to destroy fully half the crop. The yield in California is very large, in instances being known where over five thousand pounds hops have been gathered from one acre, while a yield of two thousand to three thousand pounds per acre is quite common. The largest crop raised in 1867 were those of Daniel Flint, who harvested 65,000 lbs. averaging 1,300 lbs. per acre, and Flint & Haynie, who, from twenty-eight acres vines located on the American River bottom lands, a short distance from Sacramento, harvested a little over 44,000 pounds, or an average of over 1,500 pounds per acre. The yield would have been much larger but for the fact that high water in the spring overflowed the land, remaining on some portions up to the middle of May and almost destroying the vines so that they bore very few hops. There is a vast amount of land along the rivers in the interior of the State which is well suited for raising hops. Hops also grow well on rolling land but the crop per acre is less, the average yield being from 1,000 to 1,500 pounds to say 2,500 pounds on river bottoms in a good season. It is believed that California can produce better hops, larger yield, and of better average quality, than can be had in the Atlantic States, and parties, competent judges of its profitability, assert that in time the hop growers of this State will export largely to the Eastern ports and Europe. One advantage claimed for California grown hops is their remarkable strength or brewing purposes, the blossom containing an excess of lupulin—the bitter principle which makes the hop valuable for brewing purposes. The crop of 1867 has in the main been disposed of within the range of 40¢ to 65¢ per lb., the latter the closing price.

SILK.

This branch of industry seems to be making great progress in most portions of the State. The climate of California is so admirably adapted for successful silkworm culture that scarcely any risk of loss is encountered as compared with that common in France and Italy. The business is very simple to manage and can be carried on by farmers to considerable extent without interfering with their other work. It is peculiarly suitable for women and children, the labor being light, pleasant and instructive. The absence of violent electrical storms and rains in summer insures healthy worms, and, consequently, cocoons of the first quality. The mulberry of different varieties, which is now extensively planted, thrives luxuriantly in all portions of the State and furnishes food of excellent quality for silk growing purposes. Although great difficulty was experienced in procuring the original stock of eggs, no drawbacks have been experienced in their propagation since their introduction. Persons acquainted with silk culture in Europe are very sanguine that the business in California will in time become of vast proportions, and build up branches of manufactures for which the United States are now dependent on foreign nations. The silk worm not only makes better cocoons in California, but is said to reproduce its species in larger proportion than is the case elsewhere, the increase ranging from one-third to one-half more eggs.

The business is being prosecuted in almost all portions of the State, the total production of cocoons in 1866 being reported by County Assessors as two hundred and ninety-six pounds, one hundred and fifty pounds being raised in Santa Clara county. The crop of 1867 is not yet known, but it must be a large increase on that of the preceding year, one firm in Santa Barbara county having raised three hundred thousand cocoons—equal to one thousand pounds. Great preparations have been made for extending the business in 1868 the present year, from which its success as a permanent branch of domestic industry will probably be determined. Mulberry trees have been planted in most of the valley counties, and it looks likely that at least ten tons raw silk will be made the present year. In Sacramento county one person, Wm. M. Haynie, has over half a million of two year old trees, and

has five million eggs, all of which he expects to hatch during the months of May, June, July and August. As three hundred cocoons average a pound of silk, it will be seen that from five to six tons can, under favorable circumstances, be raised by this one party alone.

In silk reeling and weaving a successful attempt has been made by Joseph Newman, who has produced several pieces of silk goods, in appearance of very creditable quality. Attempts are now being made to build a large factory to manufacture silk fabrics at San José, Mr. Newman being the projector of the enterprise.

PITCH, ROSIN AND TURPENTINE.

The immense pine forests of this coast afford the raw material for manufacturing these articles in the greatest abundance, rendering their supply from home sources always cheap and certain. Both in California and Oregon the business of gathering the sap or raw Turpentine from the pine trees by tapping, is quite extensively engaged in; and though the prices have gone down, under importations from the East, the business appears to prosper. So far, this branch of business in California has been confined to Butte county, where it has been carried on for a number of years past. The sap, when gathered, is manufactured into Rosin, Pitch and Turpentine at Marysville, none of the raw material coming to this city. Last year a little over 20,000 gallons of Turpentine were produced—not so much as the year before, owing to low prices. The present year a much larger quantity will be made. The product of Rosin last year was 2,500 cases, scarcely half the usual quantity. These articles could be delivered here cheaper than the imported, were it not for costs of freight from the interior. With a reduction here, Domestic Turpentine would be able to keep the Eastern article out of our market. Last year the price was \$1, but 65 cents per gallon in this city. It is now worth \$1, but with larger production it will probably decline again.

SALT.

From ten to twelve thousand tons of this article are made annually, in Alameda county, from sea water, by the process of solar evaporation. There are 18 companies at this place, employing 150 men. Their reservoirs cover many hundred acres of the low and formerly worthless lands along the Bay. The Salt produced here is worth in San Francisco at \$8 to \$10 per ton. A good deal is also made by the same process from the saline waters of small ponds and springs situated in various other parts of the State, the product of which is mostly required for consumption in the vicinity of these several works, though some portion of it also reaches this market. The Pacific Salt Works near Los Angeles manufacture considerable quantities every year, several hundred tons of which are annually sent to San Francisco. In Colusa county a considerable quantity of good salt is made by evaporating the waters of a group of saline springs situated 30 miles southwest of the town of Colusa. At several places in Kern county this article is produced in quantities sufficient for all local uses, by evaporating the waters of springs and ponds, whereby a very good article is made. About 35,000 tons of coarse rock or salt are ground every year by the mills in this city, of which there are six, the most of them kept constantly at work.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20, 10 cents.
Over \$20 and not exceeding \$50, 25 cents.
No fractions of cents to be introduced in an Order. United States Treasury Notes, or National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained. Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out: No. Amount Date,, 1867.

MONEY ORDER.

Required for the sum of \$.... Payable at State of Payable to Residing at State of Sent by Residing at State of Entered in Register:

Names of parties and places, and the sums, to be written in the plainest possible manner.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

List of Money-Order Post Offices in the Pacific States and Territories, May 20, 1867.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Kuo, is our duly soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1886.

Mr. C. T. Roney is our duly authorized agent for Sacramento County. Nov. 23, 1887.

Mr. J. C. Yates is our duly authorized traveling agent. July 6, 1887.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1887.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17, 1887.

OUR NEW YORK AGENT.—Mr. M. A. LATROFF, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No. 725 Broadway, for the present. Nov. 26, 1887.

San Francisco:

Saturday Morning, Jan. 18, 1886.

Notices to Correspondents.

C. W. L.—The evolution of ammonia combined with acid or otherwise from volcanoes, has been doubted by many. The subject has been very elaborately treated by Prof. Bunsen, who cites as corroborative if not confirmatory of his views, that during the eruption of Hecla in 1846, when the lava issued from the deepest of the four newly formed craters and spread over the plain of Thjorsa, that when the professor was sojourning on the spot in July, only a few months after the eruption, he observed that the lower portion of the lava stream was studded over with smoking fumeroles, in which a large quantity of beautiful crystallized muriate of ammonia was undergoing a process of sublimation, and some hundreds of pounds could have been collected. That this phenomenon was only observable where meadows had been overflowed by the lava. Higher up where the last traces of a stunted cryptogamic vegetation disappeared, the formation of the salt ceased also. The large fumeroles at the back of the crater, and even of the four new craters, yielded only sulphur, muriatic and sulphurous acids, without exhibiting the slightest trace of ammoniacal products.

R. B.—Gay Lussac was the first who made the observation that a crystal of potash-alum, on being put into a solution of ammonia-alum, continues to increase without changing its form. Beaudant subsequently found, that a mixed solution of sulphate of copper and sulphate of iron, would give crystals, having the form of the latter, but still containing a considerable quantity of copper. Mitscherlich was the first who observed an identity of form in a sufficient number of cases to determine that this phenomenon was the consequence of a similarity in composition. He termed this similarity in crystalline forms *isomorphism* (from two Greek words, meaning like and form), and the bodies, which assume one and the same form, he named isomorphous bodies.

L. B.—Whenever substances chemically unite, directly, heat is emitted, and the more rapidly the union is effected the greater is the quantity of heat emitted in a given time; until, in some cases, it rises sufficiently high to cause ignition and combustion; light, as well as heat, being abundantly extricated on obtaining a sufficiently high temperature, as all solid substances, when heated beyond a certain point, become luminous.

S. M.—During the last twenty years no inconsiderable number of artificial organic bases have been formed by chemists, similar in all respects to the natural alkaloids. The methods adopted in laboratories most probably resemble those employed by nature. The chemists of England, France and Germany, have for some time devoted great attention to the discovery of cinchonine or quinine.

CHURCH OFFICERS Elected.—At the annual meeting of the Union Square Baptist Church, held last Monday evening, the following named officers were elected for the ensuing year: Trustees—J. S. Ring, H. B. Angell, L. L. Alexander, W. B. Ewer, H. M. Rosekrans, H. K. Cummings and W. S. Beebe; Treasurer, George M. Wood; Clerk, Thomas S. Way.

Miners Their Own Law-Makers.

Mr. Steele, member of the Assembly from Siskiyou County, has introduced a bill, the object of which is to regulate the taking up and holding of mining claims. By it, the Justice of the Peace in each township is made the Recorder of Claims, and a long tariff of fees established for the benefit of the aforesaid officer and the constable. New mining regulations and amendments of those existing can be adopted only at a meeting called by the Justice, who presides in person, receiving four dollars per day for so doing.

It is not probable that the proposition will be received with general favor by the miners. They like to make their own laws, appoint their own officers, and establish their own fees. And above all, the last man for Recorder of a mining district is, it seems to us, the magistrate in that district. The majority of cases upon which a Justice of the Peace in a mining section is called to decide, are, perhaps, those relating to mining matters; and, as the Recorder is, of necessity, the first man who knows the exact location of a new discovery, he often becomes personally interested in the question of mining title to such an extent as to disqualify him to decide with impartiality upon that question. The expense, too, of the new plan will be an objection. Under the present arrangement, many claims,—especially those upon vein mines,—are entered upon the records of the county; and the miner can always, if he chooses to pay the regular fees, thus have an unquestionable record in addition to that made with the Recorder, chosen by himself and his mates.

As the adoption becomes general of the plan of acquiring a title in fee to mining locations, in accordance with the Congressional Act enabling thereto, the whole class of questions relating to these matters will be found to simplify and arrange themselves; many of these questions will in fact disappear entirely. It is to be desired, therefore, that the matter be thus left to adjust itself without interference.

HANCOCK MINING Co.—Mr. S. S. Sweet, Secretary of the above named company, which is located in Del Norte county, has laid upon our table specimens of the new gold-bearing ore which has recently been found to occur in large quantities in this mine. This ore is very similar to the "gossan" which generally accompanies copper mines; but which is usually confined to the croppings, or extends to but little depth below them. This ore is evidently a decomposed auriferous sulphuret, and from working processes in this city is known to yield from \$12 to \$15 per ton. It occurs in large quantities, and is easily mined and crushed, and extends to the deepest portion of the mine yet reached—fully 175 feet. We understand that the company is about to erect a small mill for the purpose of crushing this ore, which, it is confidently believed, will prove a very profitable operation for the shareholders.

IDAHO ORE.—We have received a call during the week from a gentleman recently from Idaho, who showed us some specimens of silver ore from that region. The samples are from the Banner mine, Silver Hill district, and Sophia Tracy ledge, in Yuba district, and are really beautiful specimens. Where the ore has been roasted, the globules of silver can be distinctly seen studding the surface. Such ore would do credit to any mine in any country; and but for the distance which separates these mines from some point of supply, making the cost of transportation so great, they would be ranked among the best ever discovered. Accompanying the ore were two small bars of silver taken from ore belonging to the famous Atlanta ledge. The Atlanta has a vein sixty feet wide, and the ore lays in pockets or chimneys, interspersed through the vein. It is the most flourishing mine in Idaho. The bars will be forwarded to Mr. French, at South Bend, Indiana, who is one of the owners in the ledge.

Kustel's New Book.

A TREATISE ON CONCENTRATION OF ALL KINDS OF ORES; including the Chlorination Process for Gold-Bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally. By GUIDO KUSTEL, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction." With 120 Diagrams on Seven Plates. San Francisco: Office of the MINING AND SCIENTIFIC PRESS, No. 505 Clay Street.

This work is designed chiefly to show the present condition of the art of concentration; simply setting forth the principles on which it is founded, without entering into scientific details or considerations. It opens with an introduction, descriptive of the dressing of ores, explaining the principles and objects thereof; also, the separation of ores or sorting of the rock, with reference to its value or worthlessness, and with regard to the different minerals which it may contain, detailing the proper mode or modes by which that object may be most conveniently effected. The work also describes and illustrates various cleansing and sizing contrivances, the long use of which in European mines has fully proved their value. The whole is so arranged and illustrated by diagrams as to enable any one accustomed to handling ores to be successful in concentrating them.

Seventy-five pages, exclusive of illustrations, are devoted to a lengthy and elaborate treatise on the reduction of ores, including the erection and treatment of stamp-works, descriptive in detail of various batteries, speed, curve, and order of lifts, feeding and discharge of batteries, reduction by rolling mills, construction and operation of grinders, etc., etc. All these various processes and classes of machinery are treated upon quite fully and clearly, and explained by numerous illustrations.

The author next proceeds to an elaborate discussion of the concentration of ores, stating briefly the principles on which the process depends, with fully detailed and illustrated descriptions of nearly fifty different inventions which have been devised for accomplishing that end. All but one of the different California concentrators are described and illustrated—six in number. Among the concentrating machines; the preference is given to self-discharging, continuous contrivances; and among these to such as have been quite fully investigated as to their efficiency—the amount of power and water required to run them, their proportion of loss, etc.—circumstances quite too much neglected with California inventors and millmen. A short description of many less important contrivances is given, for the reason, as the author says, that the knowledge of them may prevent many persons from spending time and money on inventions which may be supposed to be new, but which, in fact, have already been tried and discarded for more effective devices. Upwards of ninety pages, exclusive of illustrations, are devoted to this portion of the work. One chapter is devoted to "Special Concentration" of gold, silver, lead and copper ores, closing with several pages on the "Value of Ores for Concentration."

The work concludes with a carefully written treatise on the chlorination of gold and silver ores, giving a full description thereof, with full illustrations, such as are quite sufficient to give any person at all conversant with such matters a correct idea of both the mechanical and chemical operations connected with the process. This portion of the work has been prepared in consequence of the general demand for information on the subject, and the great importance and interest at present connected with the treatment of sulphurets—the extraction of the gold therefrom being very difficult and exceedingly unsatisfactory by most or all other processes.

Indeed, the entire work is just what is needed at the present time on this coast, where so little is known of what has been done in other countries in those departments of mining to which the work is espe-

cially devoted. We shall give some extracts from this book in future numbers; in the meantime, we would advise all persons interested in the treatment of the ores of gold, silver or copper, to procure the work and study it thoroughly. It may be obtained at this office and at the book stores generally. Price, \$7.50. For the convenience of those who reside at a distance from settled towns where dealers in books may be found, the work will be supplied from this office by mail, post-paid, on the receipt, free of expense, of \$7.50 in coin.

The Mechanics' Institute Fair.

The Board of Supervisors have granted the Mechanics' Institute the use of Union Square for the purpose of erecting thereon a building in which to hold the next industrial exhibition of the Institute. As we have already stated, it is proposed to make the coming exhibition one of the most comprehensive and creditable displays of the productive and mechanical industries of the Pacific Coast which has been attempted; also to give it an international character, so far as to embrace all the countries bordering upon both sides of the Pacific Ocean, also Australia and other islands in that ocean. Such a display cannot fail to prove of immense practical benefit to this State, and to the Pacific Coast generally. The city has acted promptly and generously in granting to the Institute the only practically available spot in the city where such an exhibition can be most conveniently made a success.

The managers of the Institute are already actively engaged in maturing the plans necessary to such a display, and are industriously laboring to secure the cooperation of our own people, and kindred bodies in adjoining States and territories, and are endeavoring, through the proper channels, to interest the foreign governments, alluded to in the exhibition.

An application has been made for a money grant from the State, in the form of premiums, similar to the same kind of aid which is extended to the annual exhibitions of the State Agricultural Society. Notwithstanding the great necessity for economy and retrenchment in State legislation, we do not see any reason why the representative institution of the mechanical interests of the State should not be allowed to make at least this one call for assistance in this direction, which has been so generously and so properly extended to the representative of the agricultural interests.

Of course the managers of the Institute will be expected to exercise great judgment and the most rigid economy consistent with the magnitude of the undertaking, in all matters of a pecuniary nature. An expensive or showy structure is not needed or expected. The finances of the Institute will not admit of lavish or unnecessary expenditure; neither the public nor the exigencies of the case require such. Funds are needed to pay off the debt upon the present Institute building, to the end that the society may have more space therein for their own use, instead of being compelled to lease the same as a means of acquiring money for paying its monthly interest. The liberality of our citizens, which has never failed the Institute in any laudable undertaking, will be more likely to meet with a renewed response under such a policy than under any other mode of action.

INSTRUCTION IN CHLORINATION.—We would call attention to the advertisement of Mr. John Agrell, in another column. Mr. A. has charge of the Chlorination Works connected with the Coney & Bigelow mill, at Jackson, Amador county, which works are now in constant and most successful operation, and afford a most excellent opportunity for persons, in that part of the State, to secure a thorough, practical and scientific knowledge of this important and most approved method for the treatment of auriferous sulphurets.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors in the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

72,058.—CENTER-BOARD FOR VESSELS.—F. J. McFarlan, San Francisco, Cal.:

I claim the location of the center-boards, or other equivalent devices for the same specific purpose, in the extreme bow and stern of vessels, that is to say, the placing of the said boards forward of the foremast, or aft of the mainmast in two-masted vessels, and forward of the foremast and aft of the mizzen-mast in three-masted vessels, substantially as shown and described, and for the objects and purposes specified.

72,064.—DERRIK.—D. J. McDonald, Gold Hill, Nev.:

I claim 1. The derrik-standard L and frame K, fitted in the derrik-frame J, and arranged, as shown, for the ready adjustment of the standard L.

2. The fitting of the derrik-frame J on the wagon-frame, as shown, to wit, by means of the circular-plate, D, frame, E, and circular plate, G, with the wheel, E, and pinion Y, to admit of the ready turning of the derrik, as set forth.

3. The supports D', provided with screws a, and attached to the frame, B, as shown, in connection with the bevels b in platform, C, for the purpose of leveling the device, substantially as described.

4. The annular platform, C, applied to the wagon, A, when used in combination with a revolving derrik-frame, J, substantially as and for the purpose specified.

72,091.—IMPROVEMENT IN CARRIAGES.—Anson Searls, San Francisco, Cal.:

I claim 1. The axle composed of the steel bars d and g, attached as herein described. 2. The clip, b, passing around under the axle, with its ends fastened to the plate a on the rocker, both before and behind the axle, substantially as described.

This invention relates to the construction of carriage axles, which the inventor forms like an inverted T, which very much strengthens the axle, with the use of but little metal. It also combines an improved steel circle, upon which the body turns, upon the front axle, the whole forming a combination which is cheaper, easier, and more durable than any now in use.

72,110.—STREET PAVEMENT.—Henry M. Stow, San Francisco, Cal.:

I claim 1. A wooden pavement, composed of alternate tiers of square-ended and wedge-shaped ends of the latter being driven down into a foundation-bed of sand or earth, substantially as and for the purpose described.

2. A wooden pavement, composed of blocks with lower ends wedge-formed, and all driven down into a foundation-bed of sand or earth, substantially as shown and described.

72,111.—STREET PAVEMENT.—Henry M. Stow, San Francisco, Cal.:

I claim 1. The cast iron plates, with projecting wedge-shaped flanges, to be driven into the sand or earth, substantially as and for the purpose set forth.

2. Also, a pavement composed of alternate tiers of cast iron plates, with projecting wedge-shaped flanges and wedge-shaped wooden blocks, driven into the sand and earth, substantially as described.

72,138.—APPARATUS FOR ENAMELING PHOTOGRAPHIC PICTURES.—Nathaniel Weston, San Francisco, Cal.:

I claim the rest, A, for the glass, or its equivalent; the use of the glasses, B, B, the weight, G, the fastenings, H, the clamps, E, E, or their equivalents, in part or in combination, for the purposes herein set forth.

72,182.—IMPROVED ORE CONCENTRATOR AND AMALGAMATOR.—Stephen Fountain, Silver City, Nev.:

I claim the box, D, having the lever, b, stems, n, or an equivalent device, together with the operating lever, d, and the rods, g, the whole constructed and arranged substantially as and for the purposes described.

The object of this invention is to construct an improved variable central discharge for concentrators and amalgamators, by which the lighter and worthless contents can be easily discharged, as desired, while the heavy and more valuable portion being thrown to the circumference of the containing vessel, by the centrifugal motion, are not in danger of being lost when the gates are opened.

72,202.—IMPROVED SPRING BED BOTTOM.—Frank A. Huntington, San Francisco, Cal.:

I claim the standard, A, with caps or tops, a, and the elastic bonds or springs, B, arranged and attached to frames or bars, substantially as and for the purposes described.

The object of this invention is to provide a cheap, durable and easy spring for beds, sofas, lounges and other articles of furniture, and consists in attaching to the cross-bar or boards of beds or furniture, between the openings, standards of wood or other material, having a cap or pad upon the top; a band or bands of india rubber being fastened to the lower end of the standard, attached to each side of the cross-bars by staples, so that when a weight is placed upon the bed or springs, those standards are pressed down between the openings, and when the weight is removed they regain their original position, with the end projecting a little below the cross-bars or boards.

72,205.—IMPROVED APPARATUS FOR SAVING PRECIOUS METALS.—William C. Knight, Yankee Jim's, Cal.:

I claim the V-shaped apparatus, with an adjustable partition, B, substantially as and for the purposes described.

The object of this invention is to provide an apparatus for saving precious metals, as from the pulp of quartz mills and the granulated quicksilver which escapes from the sluice-box. This is accomplished by placing at the end of sluice-boxes an apparatus in the form of a letter V, having a movable vertical partition through it, and a cross-bar placed upon one side of the apparatus, which prevents the escape of the valuable portions of the ore and quicksilver, while the debris and other valueless matter is carried out by the current of water into the tail-race.

72,249.—IMPROVED STRAW CUTTER.—John Weichhart, San Francisco, Cal.:

I claim 1. The manner of operating the feed roller, B, by the toothed wheel, C, and ram, D, substantially as described.

2. The cam, E, in combination with the arms, d, d, jointed to the knife, and the spring, H, for throwing it back.

3. The movable pressure plate, b, spiral springs, c, c, so that the material to be cut will be held firmly in place, substantially as described and shown.

The object of this invention is to provide an improved machine for cutting all kinds of fibrous material, but chiefly for cutting tobacco, hay, straw, and corn stalks. It is so constructed as to be self-feeding, and the material is brought under the knife in a compact form. To accomplish this a feed-box of suitable dimensions is provided, having a square edged iron or cutter-box placed across the outlet. Above this is another bar, having upright pins surrounded by spiral springs, the pins moving up and down in holes on a cross-plate. A corrugated roller, through which a rod passes, is placed across the machine, back of the knife, having at the end of the roller a toothed wheel, which a cam, placed upon a horizontal shaft, operates for turning the roller. Another cam is placed upon a horizontal shaft, which gives a peculiar motion to the knife in its downward stroke.

RECENT INVENTIONS.

ANOTHER NEW CRUSHING MILL.—the editor of the Gold Hill News has seen the model and drawings of a new machine, designed for crushing quartz, the invention of a gentleman residing in that vicinity, which is described as follows: This mill or crusher is simply an iron wheel six feet in diameter, and weighing about a ton, with a chilled iron surface twelve inches in width, which will be made to rotate alternately backward and forward over a grating composed of heavy bars, placed one, two, or three inches apart, as may be found requisite. The wheel rotates in a narrow space between two walls, and is kept in proper position by means of iron guides placed at the axle, allowing it to move freely in the directions proposed. By means of self-regulating springs and a sliding beam, an immense pressure is brought to bear from above directly upon the upper periphery of the wheel, and the motion is communicated by means of power applied to a crank in the center of the wheel, causing it to move about seven feet backward and forward as above described.

The same power which moves this wheel, also causes a little distributing car on each side of the wheel to follow it up with the requisite supply of quartz, which being distributed in the proper place, the immense pressure of the wheel is brought to bear upon it, grinding and reducing it to such a degree that it passes down through the

bars upon a screen below, where that which is not reduced to the proper degree of fineness for grinding and amalgamating by pan process, is separated for further treatment under the wheel. We do not care to enter into a minute description of the details, but all the little emergencies are provided for.

The general idea, especially of the pressure applied to the top of the wheel, partakes somewhat of the character of larceny upon the Collins mill, but is far more simple in its operation.

According to estimate with this new mill, considerably over one hundred tons of quartz can be crushed in a day, and a competent engineer estimates that a ten horse power engine will be fully competent to do the work. Millions upon millions of tons of low grade ore are awaiting some such cheap mode of crushing as this promises to be, in every portion of the State as well as in our own famous Comstock.

COLLEGE OF CALIFORNIA AND COLLEGE SCHOOL.—The catalogues of these institutions for the new year have been published.

There are twenty-one students in the college classes. Prof. Willard B. Rising, formerly of the Michigan University, has been added to the faculty during the past year. He has charge of the department of Natural Science. The Freshman class is the largest which has ever been gathered at the college. The College School has upon its catalogue the names of three hundred and one students who have been in attendance during the last year.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. Lutz, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. 1v10

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 2v15 3m

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 1v14 1f

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$30 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required.

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

ENERGETIC MEN OR WOMEN CAN MAKE MONEY in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v15 1v1p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps, all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coaling Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenos Wheeler's improved flat bottom pan, Beldin's pan, Yeatch's tubs, Frater's concentrators, Wakley's pans, Boer's pan, German Barrels, Arasira Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

BORNEO CAMPHOR.—This variety of camphor, which commands in the Eastern market about \$28 per pound, is obtained from the baru tree. The slopes of the hills on the eastern coast of Borneo are covered with these trees. To gather the camphor the tree is felled and split; and in its center the gum is found. The average amount taken from a tree is not less than ten pounds. The quality of this camphor is superior to all other varieties. A small fragment emits a very strong odor, and does not seem to lose its power for several years. Some idea of the estimate in which it is held by the Chinese may be had from the price which it commands. Formosan camphor may be purchased for about 16 cents per pound, while the baru brings 175 times more. Mr. Torrey, an American resident of the island, and having control of the northern territory, has lately brought to this country specimens of camphor, hard woods, and other interesting materials which might be imported on a large scale with profit.

Rates of Postage on Printed Matter to Europe
and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.
Lunenburg, by Bremen mail—3 cents each.
Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.
Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—4 cents each.
Italy, by Bremen or Hamburg—5 cents each.
Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.
Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.
Hamburg, by Hamburg mail—1 cent per ounce.
Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.
Lunenburg, by Bremen mail—1½ cent per ounce.
Lunenburg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.
Schleswig Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.
Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.
Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.
Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.
Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

THE FROZEN WELL OF VERMONT.—The famous frozen well at Brandon, Vt., which has attracted so much attention, is described by a recent visitor as being forty-one feet in depth and passing through a stratum of frozen gravel fifteen feet thick before reaching water. The frozen gravel was overlaid by a four-foot layer of stiff clay, and underlaid by two or three feet of gravel which was not frozen. It was dug in 1858 by Mr. Twombly, the owner, to supply his dwelling with water. In winter it freezes over generally at night, several inches in thickness, and they have to send a boy down in the morning to break it, and sometimes, in very cold winters, it freezes so hard as to be useless until spring. Last winter this was the case, and in the month of May a man had to be sent down into the well to break up the ice before water could be obtained. During the summer there is ice attached to the stones of the wall near the surface of the water, and sometimes small pieces are brought up in the bucket. Of course the water is cold at all times like ice water. The owner says the middle of the shaft is the coldest, and he complains of having caught the rheumatism by going down into it in hot weather. The extensive deposit of frozen gravel is the cause of the freezing of the water in the well; but the mystery is how did the frozen gravel get there? Was it formed during the glacial period? Wells were sunk at a distance of seventy feet on each side of this one to ascertain the cause of the phenomena. In one at twenty-nine feet, they found water of 46° temperature, while that of the frozen well was 40°. In the others they found layers of frozen gravel and ice from two inches to a foot thick at a depth of 29 to 34 feet, at which point everything was solid, and chunks of ice were picked up by the workmen, and the workmen stopped. The mystery, however, is still unexplained.—*Exchange.*

THE STRUGGLE FOR LIFE.—Certain native animals of New Zealand seem to give way before those from Europe, with which they are brought in contact. The Norway rat has completely exterminated the native rat of New Zealand. The English house-fly drives out the blue-bottled native. Capt. Cook carried pigs to New Zealand and they have increased so rapidly that the landlords now offer rewards for killing them. English weeds monopolize the soil. European clover exterminates the native flax plant, and European annuals destroy the New Zealand perennials. These facts tend to prove that organisms of the northern latitudes are more hardy than those nearer the equator.

ALLEGED CURE OF THE CATTLE PLAGUE.—Mr. Philbert, a large land owner in Southern Russia, who possesses 80,000 merino sheep, 2,000 or 3,000 horned cattle, and 500 or 600 horses, states that of all the means employed in numerous experiments made by him to preserve his horned beasts against the cattle plague, sea water, given as drink in place of soft water, had, during the epidemic, complete success. All the animals supplied with sea water were spared by the malady, including those intentionally placed constantly in contact with sick beasts.

A. T. DEWEY. C. W. M. SMITH. W. B. EWER.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (64 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and saving.

SAVING PRECIOUS METALS,

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its fifteenth volume, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886: Resolved, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

As an advertising medium throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

Specimen numbers of the Press and Patent Circulars, sent free.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

A CAVE IN A STRANGE PLACE.—The New York *Sun* says that a workman engaged in cellar excavations in Sixth avenue, near Twenty-ninth street, was startled by a giving-way of the ground upon which he stood. He sprang to avoid he knew not what, but only succeeded in going down on top of the dirt and stones, instead of having those unpleasant things fall on him. The fall was not a serious one in its effects upon the man, as became speedily known by his outcries. Though it was already nearly dark, he could be seen by the crowd who gathered around the not bottomless pit, and in due time a rope was obtained and the unfortunate individual made his appearance on the surface, more frightened than hurt. The pit, whatever it was, seemed unlike an ordinary vault, being without an arched roof. It was apparently a naturally-formed cavern, and may be of considerable extent. The bottom must have been twenty feet, or more, below the street surface.

WHAT NEW YORK IS COMING TO.—The New York *Tribune* has been reading a lesson to the "rascals" who hold high places in that city. It holds up before them, in *terrorem*, the San Francisco Vigilance Committee and its doings, and draws a parallel, sentence by sentence, between the state of things in New York at the present time and in San Francisco in 1856; and thus closes its exhortation: "Will corrupt supervisors, corrupt councilmen, corrupt judges, in our city, take a warning? 'The thieves must be driven out if it costs a bloody war, and it will cost a bloody war if they are not.'"

New Mining Advertisements.

Hannum Copper Mining Company. Location: Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of January, 1868, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 609 Market street, San Francisco. Any stock upon which said assessment shall remain unpaid on the fourteenth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the second day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. S. SWEET, Secretary. Jan 18

U. S. Grant Mining Company.—Location of Works and Mine: Excelsior District, Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the tenth day of December, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
N. M. Baxter.....	not issued	2	\$100 00
T. J. J. Baker.....	24, 25, 26, 27, 28, 29	150	289 40
E. W. Flenniken.....	3	4	24 00
E. W. Flenniken, Trustee.....	9	4	24 00
L. J. Flint.....	not issued	20	100 00
J. H. Flint.....	30	15	75 00
H. J. Hall.....	45	100	500 00
S. McFarland.....	not issued	15	80 00
J. E. Squire.....	18, 35, 36	71	355 00
Alley.....	20, 21, 22, 23	100	500 00
J. P. Wheeler.....	30, 31, 32, 33	200	1000 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of December, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J. C. Merrill & Co., 204 and 206 California street, San Francisco, on Saturday, the eighth day of February, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. L. BARKER, Secretary. Jan 18

Mining Notices--Continued.

Arizona Consolidated Mining Company, Eurca District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of December, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable in United States gold and silver coin, to the Secretary, at the office of said Company, No. 611 Clay street.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. W. BUNNELL, Secretary. Jan 18

Office, 405 Front street, San Francisco.

Chilpouca Mining Company--District of Ures, Sonora, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the third day of December, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.

Spinoni, G.....	29	9	45 00
Vincent, J.....	60	9	45 00
Vincent, J.....	60	10	50 00

And in accordance with law, and an order of the Board of Trustees, made on the third day of December, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of J. Middleton & Son, No. 404 Montgomery street, San Francisco, Cal., on Monday, the twentieth day of January, 1868, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOHN F. LOISE, Secretary. Jan 18

Office, 318 California street, up-stairs, San Francisco.

Corallera Gold and Silver Mining Company, Chihuahua, Morelos Mining District, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of January, 1868, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the eleventh day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary. Jan 18

Office, 321 Washington street, San Francisco.

Dio Padre Gold and Silver Mining Company, Altam, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of January, 1868, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at his office, corner Broadway and Battery streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eleventh day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fifth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. C. McCOMBE, Secretary. Jan 18

Office, corner Broadway and Battery streets.

Hope Gravel Mining Company.—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of December, 1867, an assessment (No. 19) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, on or before the first day of January, 1868, at the office of David Wilder, Secretary, at No. 533 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.
Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. dec21

Any stock upon which said assessment shall remain unpaid on the twenty-second day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. SIEVERS, Secretary.
Office, No. 314 Front street, San Francisco. jan4

Mount Tenaba Silver Mining Company.—Location of Works: Cortez District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of January, 1868, an assessment of two dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 514 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twentieth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twelfth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.
Office, 624 Montgomery street, San Francisco. jan4

P. S.—An allowance on the above assessment of three per cent. will be made on all payments prior to the 31st inst. By order of the Board of Trustees.

By order of the Board of Trustees.

Jan 11

R. N. VAN BRUNT, Secretary.

Office, No. 523 Kearny street, San Francisco, Cal. dec23

POSTPONEMENT.—The above sale is hereby postponed until Wednesday, the twenty-ninth day of January, 1868, at the same hour and place. By order of the Board of Trustees.

Jan 18

R. THOMPSON, Secretary.

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth (12th) day of December, 1867, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, Montgomery street, near Jackson, San Francisco, or to John H. Slaven, at Silver Mountain.

Any stock upon which said assessment shall remain unpaid on the twentieth day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the sixteenth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. dec21

Lady Bell Copper Mining Company, Low Divide Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of January, 1868, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to J. K. Johnson, at Crescent City.

Any stock upon which said assessment shall remain unpaid on the twentieth day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the second day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

B. P. WILKINS, Secretary.
Office, 618 Market street, San Francisco, Cal. jan1

POSTPONEMENTS AND ALTERATIONS.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at the earliest convenience. New advertisements should be handed in as early as possible.

Lyon Mill and Mining Company, Kelsey District, El Dorado County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-seventh day of November, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John Fargue	33	3	\$1.00
D. Lee	33	3	1.00
J. W. Loker	42	1	.50
R. Boran	61	16	8.35
John Fargue	32	3	1.50
Chas. S. Lord	40	25	12.50

And in accordance with law, and an order of the Board of Trustees, made on the twenty-seventh day of November, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Olney & Co., auctioneers, 418 Montgomery street, San Francisco, Cal., on the seventeenth day of January, 1868, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.

Office, No. 5 Government House, corner Washington and Sansome streets, San Francisco, California. jan4

POSTPONEMENT.—The above sale is hereby postponed until Monday, the 27th day of January, 1868, at the same hour and place. By order of the Board of Trustees.

Jan 18

J. M. BUFFINGTON, Secretary.

La Blanca Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of January, 1868, an assessment of two dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 514 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. SIEVERS, Secretary.

Office, No. 314 Front street, San Francisco. jan4

Mount Tenaba Silver Mining Company.—Location of Works: Cortez District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of January, 1868, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 426 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twentieth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twelfth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Jan 11

R. N. VAN BRUNT, Secretary.

Neutra Senora de Guadalupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third (3d) day of January, 1868, an assessment (No. 30) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PFEIFFER, at the office, No. 210 Post street, or to the Treasurer, A. H. WILKINS, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the tenth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the third day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco, Cal. jan11

Old Colony Silver Mining Company.—Location of Works: Austin, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of December, 1867, an assessment of two dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 523 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twelfth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY O. HOWARD, Secretary.

Office, 523 Montgomery street, San Francisco. dec21

Oxford Betts Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of November, 1867, an assessment (No. 25) of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of December, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifteenth day of January, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary.

Office, 212 Clay street, San Francisco. no23

POSTPONEMENT.—The day for doing stock delinquent on the above assessment is hereby postponed until the twenty-ninth day of January, 1868, and the sale thereof until Wednesday, the twelfth day of February, 1868. By order of the Board of Trustees.

dec23

GEO. H. PECK, Secretary.

Rippon Gold and Silver Mining Company.—Location of Works: Silver Mountain Mining District, Alpine County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the seventeenth day of December, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable forthwith, in United States gold and silver coin, to the Secretary, No. 57 Stevenson street, between First and Second streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of January, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the eighth day of February, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

P. CARROLL, Secretary.

Office, No. 57 Stevenson street, between First and Second, San Francisco. dec21

San Francisco and Castle Dome Mining Company. Location of Works: Castle Dome Conny, Arizona Territory.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twentieth day of November, 1867

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have been constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is drawn to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp to constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mull men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, This Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,
Pacific Iron Works.
San Francisco, Aug. 29, 1867.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
San Francisco.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND PLACER MINERS, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address
Dr. J. B. BEERS, San Francisco,
Per Wells, Fargo & Co's Express.

310 Washington street, San Francisco

NOTICE TO MERCHANTS
AND
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no sliding or landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction hoist, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO.

By Joseph Moore, President.

21v15 1f

JOSEPH MOORE.

HUNGERFORD'S
Improved Concentrators.

MR. HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Goss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to.

MORGAN HUNGERFORD.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, per hour, \$600
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour, price, per hour, \$50
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, price, per hour, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of compromising, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California, and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Received First Premiums at the California State Fairs of 1866-7.

Send for Circular.

A Steam Pump without Engine, Piston, Plunger or Buckets, using both the expansive and exhaust power of steam, and doing more work with the same amount of fuel, than any other Pump driven by steam power. It is applicable to either lighter or heavy work, whether for mining, irrigation, or other purposes. It has been used of various capacities, from 50 to 40,000 gallons per hour, and can be made of any size required. It is not injured by sandy or muddy water. In light of lift it is limited only by the strength of the boiler used.

For further information, apply to M. & A. WILCOX, Proprietors, No. 19 Front Street, between I & S Sts., Sacramento, Cal.

Gold Beating.

The origin of the art of gold beating, says the N. Y. Post, is not known, but it seems to be of some antiquity. It was known in Greece, and is mentioned by Homer. The ancient Peruvians made very thin sheets of gold and nailed them together on the walls of their temples. On the coffins of the Theban mummies, specimens of original leaf are met with where the gold is in so thin a state that it resembles modern gilding. The art seems to have been practiced in India, as there are rude specimens of gilding at Tipoo Sahib's palace at Bangalore.

The thickness of the leaf is spoken of by Martial as like a vapor, and by Lucretius it is compared to a spider's web. From a description by Pliny of Roman gilding, the thinness of the leaf bore no comparison with that of the modern gold beater. By his account, an ounce of gold was made into 750 leaves, each four fingers square. This is about three times the thickness of the leaf now in common use; but some qualities are so thin that two hundred and ninety thousand sheets make a pile only one inch in height; and specimens have been made only 1-376,500ths of an inch in thickness, which is 1,200 times thinner than ordinary printing paper. The thinnest gold leaf of French manufacture is not thicker than the 480,000th part of an inch; that of the English is about the 300,000th part. The American gold beaters claim to have attained a perfection in the art rivaling the best of either the English or French manufacture.

In the last stages of the operation of gold beating, when the gold has become very thin, an exceedingly fine membranous substance is used between the leaves, which is said to be made of the intestines of oxen. This is called gold-beater's skin. The manufacture of this article is a secret which, it is said, only five men in the world now know. The art of preparing it has brought a fortune to the manufacturers. Wickstead, of London, attained the highest perfection in the art in the last generation, and promised to leave the secret to a relative at his death. In his dying gasp he called the relative to his side to open the mystery, but died, and it still remained a secret. F. Puckridge, of London, is the most celebrated maker now. With great perseverance and expense he succeeded in perfecting the art. He has promised, it is said, to reveal the secret to a nephew.

LOOKING TO THE PACIFIC.—There were upwards of 15,000 more persons who came to the State seaward last year, than left by steamers. At least 1,000 must have come overland, very few departing in the same way. Sixteen thousand persons is a comfortable gain to the population of the State. It is a great advance over the former year, when the gain from all sources of immigration could not have exceeded 5,000—and better yet as compared with 1865, when the loss was set down at 3,780. There are many indications that the accessions will be larger this year than last. Not the least of these is, that more people are interested in this coast than ever before, excepting perhaps during the height of the "gold fever." People are looking toward the Pacific in sober earnest. Prejudices have been dissipated, mischievous errors corrected, and there is now more accurate knowledge concerning our resources than at any former period. * * * The tendency of Californians to return to the States has often been deprecated. But somehow they don't stay there. It is unreasonable to suppose that at least one visit should not be made in a lifetime, to the old homestead. But for each Californian who is planning a visit eastward, something like a half a dozen of his friends are quietly arranging for a visit to this State.

Of course the Pacific Railroad has quickened this interest. The hearts of a multitude of people, who have friends here, follow this iron way. It is the great emigrant trail of modern times. A good railroad has never yet failed to centralize population. What will the Continental Railroad yet do in this respect for California? And what will the three roads yet to be built do for the whole coast? This growing public interest in all that pertains to this State, is to be hailed as one of the most auspicious signs of future prosperity. There are towns to be built, roads to be constructed and fields to be sown and reaped by thousands who have not yet seen these shores, but whose interests have been so enlisted that they can work out their destiny nowhere else.—Bulletin.

It is a rule of the Prussian Board of Trade that every fifth wheel in a railway train must have a brake.

STUPENDOUS RAILROAD CONSOLIDATION. The Chicago Journal says:—There is a rumor in railroad circles that a grand consolidation, under one management, of connecting railroads between New York and the Pacific Ocean is probable. Commodore Vanderbilt, the railway king of New York, and Hon. William B. Ogden, the railway king of Chicago, and their friends, are said to be negotiating for the joint control of the Hudson River and Harlem railroads, the New York and Erie, the Lake Shore lines from Buffalo to Toledo, the Michigan Southern, all the branches of the Chicago and Northwestern, and the Union Pacific Railroads, all to be consolidated under one management, and to be operated as a common interest. We give the rumor for what it is worth, without any positive knowledge as to its truth. Should the rumor prove correct and the consolidation be effected, it would be one of the most stupendous powers in the world, as far as extent of capital and operations is concerned.

ST. LOUIS IN DANGER.—St. Louis is again in danger of becoming an inland town. A careful examination by the city officials, the other day, revealed the fact that the Missouri river, which discharges into the Mississippi some twenty miles above, sends its volume of water at right angles across with such force against the Illinois shore as to have worn it away nearly a mile. There is some danger of the river making a channel through the American bottom, so as to leave St. Louis three miles from the stream. It is proposed to rivet the Illinois shore with stone, where the river impinges, to keep it from wearing away.

ANTIQUITY OF THE WINDMILL.—The screw propeller is probably as old as the windmill; and a windmill of the construction now usually employed is shown in the seventy-seventh proposition of Hero's "Spiritalia," a work written 130 years before the Christian era.

Mineral Land Law Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
- II. Diagram, Description of Diagram and Boundaries, and Notice.
- III. Register's Order for Publication—with Notice.
- IV. Deposition that Notice has been Posted.
- V. Application for Survey Etc.

PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

The "Live Yankee Furnace," Colorado.

There appears to have been quite a brisk controversy going on for some time past, in Colorado, between the respective proprietors of what is known as the Bruckner Furnace, recently patented by Reese, Krauss & Bruckner, and a similar one known as the "Live Yankee Furnace." The paragraph which we gave with regard to the latter, and which has come back to us, as given below, from the aggrieved party, should have been credited to a correspondent of the Colorado Times, instead of to that paper as editorial.

It is proper to say that the letter from which that paragraph is extracted was evidently written by an interested party, and should consequently be taken with many grains of allowance. We publish the following with pleasure:

CENTRAL CITY, Col., Dec. 30th, 1867.

EDITORS PRESS: The subjoined paragraph from your paper of Dec. 7th, having attracted our attention, we beg to make a correction of the impression you seem to have concerning our furnace:

The Live Yankee furnace seems to have proven a failure. There were furnished to them two tons of ore from the celebrated Young America lode, assaying \$133 per ton. It was handled in such a wretched way that the bullion obtained was only .230 fine. One bar, weighing 131½ ozs. troy, was refined by cupellation, and yielded 26 ozs. of fine silver. A little more than 50 per cent. of the silver was obtained. Next a lot of rich ore from the White lode was tried.—Times.

This is a portion of a letter written to the Times by the manager of Garrett, Martine & Co's works at Georgetown, and was signed by him, Chas. A. Martine; still you seem to give it as editorial of the Times. The facts are that we are about to erect works at Georgetown for operation next season, and as Martine & Co. now charge about \$100 per ton for treating ores, they are of course jealous of the prospect of works being put up under their nose of twenty tons capacity per day, which will treat ores for a merely nominal price, say \$30 per ton.

This, gentlemen, are the true facts in the case, and in order to further assure you, we enclose a copy of Mr. Martine's letter. We ask no favors at your hands, but simply justice. As we are unacquainted in your section, we inquired of Dr. A. Blatchly, who is now here, and he assures us that you will make the necessary correction. He has examined our furnace and pronounces it far superior to anything of the kind now in use here. Begging your indulgence for this molestation, we remain, yours truly,
GALLUR, CASHMAN & FARRELL.

FAREWELL CONCERT.—The farewell concert, given at Platt's Hall on Thursday night, by Mme. Stella Bonheur, attracted a crowded and most brilliant audience. That gifted child of song may well feel highly gratified by such a parting complimentary tribute from her San Francisco friends. Her extraordinary power and compass of voice was never displayed to better advantage or more highly appreciated. Signor Bianchi and Signorina Bellini sustained their parts most admirably, as, in fact, did each and all of the distinguished vocalists who took a part in this interesting musical entertainment. The instrumental portion of the programme was also of the highest order, and was a most fitting accompaniment to the vocal display.

CALIFORNIA ACADEMY OF SCIENCES.—The adjourned annual meeting of the Academy was held at Rooms No. 622 Clay street, on Monday evening last. The following gentlemen were elected officers for the year: President, J. D. Whitney; Vice President, James Blake, M.D.; Corresponding Secretary, H. N. Bolander; Recording Secretary, Theodore Bradley; Treasurer, Edward Bosqui; Librarian, A. Kellogg, M.D.; Director of Museum, Robert E. C. Stearns. Prior to the election, a new constitution was adopted. Several letters were read from foreign societies, requesting the Academy to exchange its publications with them; after which, the Academy adjourned. The next meeting will be held on next Monday evening, when some interesting papers will be read.

MOSHEIMER'S Pioneer Mining School,

ASSAY OFFICE

—A-B-D—

Metallurgical Works, SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1.—Assaying of Ores, Metals, and other Mineral Substances.
- 2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.
- 3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.
- 4.—Concentration.—Dressing of Ores.
- 5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.
- 6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at any establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked
JOSEPH MOSHEIMER,
Pr. Chemist, Metallurgist, C. E., etc.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Seely.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After an careful and thorough perusal of the same as it contains, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Ferry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Drayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Loring.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to like sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains its place in the literature of the city. It is a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Atlas California.

The writer, the lawyer, the minister, or the statesman, may study his rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times.

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, he should say, neatly and skillfully dissects it—dissects one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the end is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men, and women too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

UNIVERSITY COLLEGE SCHOOL OF MINES.

Corner Geary and Stockton streets.

ON THE SIXTH DAY OF JANUARY, 1868.

A course of Lectures on

Chemistry, Metallurgy, Mining and Geology,

Will be commenced, and continue for four months from date. The special objects of these Lectures will be to afford those practically engaged in Metallurgical and Mining pursuits, full and complete information on all points bearing on the useful minerals of this coast, together with practice in the Chemical and Metallurgical Laboratories.

Price for the full Course of Lectures and Practice in the Laboratory, \$120.

Terms for Lectures alone, \$10 for each subject

For particulars apply to

THOMAS PRICE,
University College, San Francisco.

SIXTH INDUSTRIAL EXHIBITION

UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE,

SAN FRANCISCO.

The undersigned, acting under authority from the Mechanics' Institute of the City of San Francisco, take great pleasure in announcing to the public that they have resolved upon holding an Industrial Exhibition in the month of August, 1868, on a much larger scale than was ever before attempted on this coast; and they make this early announcement of their intention, that all who may desire to participate shall have ample time for preparation.

A programme, embracing rules and regulations for the government of participants, with a list of Preliminary to be awarded, etc., is receiving such earnest and careful attention as the importance of the enterprise demands and in due season the same will be made public by circular letters widely distributed, and by advertisements in the leading journals of this coast.

Executive Committee:

GEO. K. OLIVAS,	P. J. O'CONNOR,
THOMAS YOUNG,	EDWARD NUNAN,
D. E. HAYES,	GABRIEL ELLIOTT,
HORACE D. DUNN,	H. F. WILLIAMS,
GEO. T. BOHEN,	C. M. PLUM,
H. ROSECRANS,	J. A. PHITCHEARD,
C. H. HARRISON,	W. J. LEWIS,
D. E. COLEMAN,	W. W. HANSCOM,
W. C. PEASE,	JOSEPH MOSHEIMER,
JAMES SPIERS,	WILLIAM GORCORAN,
C. L. TILDEN,	D. A. MACDONALD,

San Francisco Metal Market.
Stock Prices—Bid and Asked.

Avery's Pump and Well.

The main feature in this invention consists in the appliances for sinking the well. The principle is as follows: A tube of iron is made pointed and closed at the lower end, perforated with a number of holes near the lower extremity. In order to drive the tube into the earth, a pointed iron slug is inserted; the tube is then forced into the ground either by the pile-driving process or by turning, as an augur, under pressure. The plug prevents the filling up of the

tube with sand or mud. When the tube has been driven the desired depth, it is withdrawn about six inches, sufficiently to allow the free ingress of water through the small holes near the extremity of the same, as well as through the narrow annular opening around the shoulder of the plug. If it should be subsequently found necessary or desirable to sink the pump lower, it can readily be done, as will be apparent from an examination of the illustration annexed.

The position and use of this plug will be seen by referring to Fig. 1 in the engraving. By close observation it will be seen that the lower valve of the pump is protected from the intrusion of foreign sub-

stances which would interfere with the working of the valve, by an oblong iron strainer projecting downward. The water is of course drawn from the surrounding earth by the creation of a vacuum by the action of the pump.

When the tube is driven to the desired depth, the pump rods and valves can be readily placed in the same, and withdrawn at any time for repairs or adjustment if necessary. The valves are extremely simple, consisting of metal balls, with no packing to get out of order. This is the only pump that digs its own well. A well thirty or fifty feet deep may be dug and put in working order by means of this ap-

Root's Force Blast Rotary Blower.

All foundrymen and iron workers generally are impressed with the importance of a good, effective and durable machine for producing a blast for foundries and kindred purposes, one which can be made at a moderate cost. The most common machine heretofore employed has been that of the rotary form, devised with various modifications. The great drawback to this method of obtaining a blast arises from the fact that great speed is essential to effective work, thereby engendering much friction, and wear and tear, and a large expenditure of power. Cylinders working on the princi-

ROOT'S FORCE BLAST ROTARY BLOWER.—Fig. 1.

paratus in a few minutes, or a few hours at most, according to the nature of the ground. The cost of the same is but a trifle compared with the ordinarily tedious process of well sinking. The cost of both well and pump is but a little more than the cost of the pump alone. For the first few minutes after setting the pump in motion, the water comes up largely mixed with earth or sand. As soon, however, as a small open space is formed around the bottom of the pump, pure water is raised, and continues so to flow as long as the pump is operated, or the water stands in the surrounding earth above the level of the bottom of the pump.

Fig. 2 exhibits a peculiar mechanism of pump machinery, which is moved by a double cog-wheel and spring. A reciprocating action is imparted, which secures a continuous stream and easy action.

This pump has recently been introduced into England, where it is known as the "American Tube Well." A trial was recently made near Manchester; the tube was sunk and water reached in five minutes from the commencement of the operation of sinking. This apparatus was used by our armies in the late war, and was often found a very valuable aid in the procurement of water as the camps were moved from place to place. S. P. Roberts, at 318 Pine street, is the agent for California and Nevada.

PUSHING AHEAD.—Charles Crocker, Superintendent of the Pacific Railroad, advertises for proposals to transport 2,000 tons of iron from Cisco to Coburn's station within the next ninety days. There is good sleighing all the way.

ple of the air pump have also been employed to some extent; but their use has never become general.

A great desideratum in blowers is their capacity to give a positive blast—measuring and forcing forward a definite quantity of air each revolution. Such a result cannot be obtained by the fan, but is obtained by a cylinder and piston. Some few years since, Messrs. P. H. & F. M. Roots, of Conners-

ville, Indiana, introduced what they have styled a Force Blast Rotary Blower, which exactly meets the requirements of a positive force blast, without the use of a reciprocating motion. We have hereto appended two illustrations of this invention, Fig. 1 showing a perspective view of the machine ready for work; and Fig. 2 exhibiting a cross section which give an intelligible idea of the manner in which the blast is generated and measured. The external case of these blowers is made of cast iron, and carefully bored out, so as to make with the

rotating valves air-tight joints. In both their external and internal parts, these blowers are fitted up with all the accuracy of a steam engine. These rollers are generally driven by two pulleys, one on either end of the main shaft; as the valves rotate towards each other, as will be seen by the direction of the arrow on the valves in Fig. 2, one of the belts must be crossed and the other opened. The position of the driving pulleys is seen in Fig. 1.

The construction of this machine is such that the same pressure of air in the blast may be obtained at a speed of 250 or 300 revolutions a minute, which in the fan blower, is attainable only by five or six times that speed. The reduction in friction and power is therefore a most important item. We have before us a large number of testimonials from those who have used this blower in the Eastern States, who testify that with the use of this blower, they are able to melt a given amount of iron by the use of one one-half less power in producing the blast, than is required by the ordinary fan blower; while the time, and consequently the fuel employed, is also very largely reduced. The friction of the machine in the machine itself in its operation, is so light that nearly the whole power applied to it, is spent in forcing the blast forward. The low speed which is required, and the simplicity of its parts renders it exceedingly durable. The first machine put up after the patent was allowed, is still in operation at Covington, Ky., still operative to all appearance as when it was first started—some six years ago.

This blower is also especially applicable to blacksmiths' fires. A No. 2 blower, running at sixty revolutions, will supply a blast for three fires; the same blower, at three hundred revolutions, will furnish a blast for twenty fires. From fifteen to twenty revolutions per minute seems to be the requirement for a single fire. The first premium was awarded to this blower at the late Paris Exposition.

There is another important consideration in the use of this blower. The smelter, by knowing the size of his furnace, can calculate, almost to a fraction, the number of cubic feet of air he needs to effect the perfect combustion of the fuel he is using; and with this blower he can measure that air out to his furnace by regulating the speed of his blower as accurately as gas is measured in a gas meter.

It is thought by many that there cannot be too much blast. That is a mistake. Combustion cannot proceed beyond a certain rate. There is indeed a considerable range; but there is a limit, easily attainable, beyond which any additional air is detrimental—any excess of air only absorbing the heat and conveying it away from the metal to be heated, thereby lessening the quantity of iron which may be melted by a given quantity of coal, supplied with its appropriate quantity of oxygen. Circulars will be forwarded by the agents, giving certain definite rules, by which the size of blower and speed of the same may be accurately adjusted to the size of furnace employed and quantity of iron which it is desired to melt. Such considerations as these will be found important matters of economy in foundry work, and may be made to effect a loss or saving in casting of from one to one and a half, or even two cents, per pound of iron melted.

One of these blowers may be seen at W. T. Garratt's Brass Foundry, on Fremont street; at the Etna Iron Works; at the Almaden Quicksilver mine, and at many other places in this State. For further information and circulars, address Keep, Blake & Co., Globe Iron Works, Stockton, Cal.

Salt Spring Valley and the Adjacent Region in Calaveras County.

(Read before the California Academy of Natural Sciences, December 16, 1887, by W. A. Goodyear, Ph. B., Civil and Mining Engineer.)

Having spent some time during the past summer in Copperopolis, and the region lying west and northwest from it, I offer the following observations respecting its topography and geology. I will first notice the

TOPOGRAPHY.

For a general description of the topography, etc., of Calaveras County, including the main features of the region in question, reference may be made to Prof. J. D. Whitney's Report upon the Geology of California, vol. I, p. 253. In addition, however, to what is there stated, I will say that Copperopolis lies at the southwestern base of Bear Mountain, the summit of which rises to an altitude of something more than 2,000 feet above the sea. The Gopher Hills, also mentioned in the report, form a well defined and connected, though subordinate range, lying to the southwest of and nearly parallel with the general course of Bear Mountain. This range forms a prominent feature in the topography of the region for a distance of at least fifteen or eighteen miles southeasterly from the Calaveras river. Its summits are probably 1,400 feet above the sea, and the lowest break or gap within the distance named is that through which Rock creek finds its way to the plains below. The valley or depression between the Gopher Hills and Bear Mountain, whose average width is four to six miles, has received the name of Salt Spring Valley. Its general altitude is little less than 1,000 feet above the sea, that of the town of Copperopolis being 900 feet, according to H. P. Handy's survey of a railroad route from Copperopolis to Stockton. I should mention that for several miles northwesterly from Copperopolis, Bear Mountain has an outlier along its southwestern base, in the form of a low but tolerably well-marked hilly ridge, between which and the base of the mountain is a narrow but continuous valley; and it is in this valley that the copper-bearing belt of Copperopolis is found. Southwest of this outlier, and for a distance of three or four miles northwesterly from Copperopolis, Salt Spring Valley consists mainly of a region of low hills, traversed by a network of steep and narrow gulches. Farther northwest the surface of the valley for three or four miles is more uniform, and here we find the nearly level area of "Tower's Ranch," and the gently sloping basin of the "Salt Spring Valley reservoir." Beyond this, the country is again hilly to the Calaveras river. Southeast and south of Copperopolis, the surface is everywhere hilly. The slope of the Gopher Hills towards the southwest is rapid until we reach the low rolling country which forms the border of the San Joaquin Valley.

Black Creek débouches from Bear Mountain a mile or so southeast of Copperopolis, and flows to the Stanislaus. Littlejohn's Creek takes its rise in the hilly region of the valley west of Copperopolis, and flowing southwesterly, finds its way through the hills into Rock Creek. The latter rises in Bear Mountain, five or six miles northwesterly from Copperopolis, and flowing southwest across Salt Spring Valley, breaks through the Gopher Hills, and continues its course through the lower country to French Camp Slough, a branch of the San Joaquin. All these creeks become dry in the summer, though in the winter they often carry very large volumes of water. At the point where Rock Creek breaks through the Gopher Hills is the substantial dam of the Salt Spring Valley Reservoir.

GEOLOGY.

The strike and dip of the rocks are more or less variable; but, so far as my observations extend in the region described, they have everywhere the same general north-

westerly trend and high northeasterly dip which characterizes so large a portion of the gold-bearing slates of central California. The strike is usually from N. 50° W. to N. 70° W. (magnetic), and the dip from 50° northeast to vertical. I have seen no case here of a decided southwesterly dip, nor of a low one to the northeast. It is somewhat remarkable, by the way, that this high northeasterly dip should be so general as it is in the great mass of auriferous slates which forms the southwestern flank of the Sierra Nevada. It is towards the granite axis of the chain, instead of from it, as would seem more natural. The causes of this are by no means as yet fully explained. It is a circumstance, however, which would lose none of its interest in the future, if, as certain facts mentioned in the Geological Report, Vol. I, p. 286, might possibly seem to indicate, further explorations should prove it to be in general a great inversion of the strata—their upper portions having been "forced back by immense pressure from above, producing a condition of things similar to that so often observed in the Alps, which is known as the 'fan-structure,' and has so much perplexed geologists." When we take into account the enormous denudation, amounting to thousands of feet in perpendicular depth, which is known to have taken place in the Sierras within the most recent geological periods, and the whole of which, in this case, must also have belonged to the inverted portion of the strata—unless indeed the inversion were produced by a peculiar sliding and bending of the strata by their own weight, the upper flexure having been since entirely removed,—and when, in addition to this we consider the hundreds of miles in length, and the great thickness of the strata in question, we can perhaps begin to appreciate the magnitude of the movements and forces which would be involved in producing such an effect. It would indeed, if true, be a striking illustration of the grandeur of the scale upon which many of the physical features of this country have been cast, as compared with those of other and better known regions. But it is hardly worth while to speculate further upon probabilities like this in the present state of our knowledge, and I return to my subject.

In Salt Spring Valley, the rocks consist almost entirely of slates, with little variety of character, generally thin-bedded, fine-grained and argillaceous, sometimes magnesian or chloritic, and often splitting with facility into very thin sheets. The thinnest bedded varieties are usually fragile, and the structure is often wavy; but sometimes the cleavage is regular and thin enough, and the rock possesses sufficient strength to furnish a tolerable material for roofing purposes; although no attempts have been made, so far as I know, to thus apply it;—and, in fact, the expense attendant upon its excavation and transportation would preclude any extensive use of it, even if its quality were unsurpassed, which it is not.

The earthy covering of the rocks throughout the valley is usually very shallow and the soil poor (Tower's ranch is, however, an exception), and in many places the thin, sharp edges of the slates project in such a way as to form an exceedingly jagged surface, though the projections are low, generally not exceeding two or three feet in height. Much of the surface is strewn with float quartz, usually in the shape of small, but partially rounded pebbles. Quartz veins of small or moderate size, parallel with the stratification, are not uncommon. Iron pyrites is of frequent occurrence, with a little gold in the quartz. Some of the veins have been more or less worked, but none of them to any great extent. About three or four miles westerly from Copperopolis, in the hilly portion of the valley, is a ten-stamp quartz mill, and a short distance from this, on Littlejohn's Creek, is the site of an older one, which was burned down. Neither of these mills ever yielded much profit, so far as I can learn, nor does the present one seem likely to do so.

Several of the gulches in this vicinity are said to have yielded gold enough in the past to pay for working, although the diggings were not rich or extensive. It is stated also that some years since, in one of these gulches, a quartz boulder was found, weighing about one hundred pounds, which yielded between two and three thousand dollars' worth of gold. There are three or four quartz veins near here, from which more or less rock has been crushed. Portions of the rock from one of these veins, the Winnemucca, a prettily-shaped vein of three to four feet in thickness, are very cellular in structure, and some of it shows fine gold quite freely to the naked eye. The metal, however, must be very irregular in its distribution, or the ore would have

paid better in the mill than the three or four dollars per ton which, I am told, it yielded; and, in fact, the general character of the float quartz of the region, when taken in connection with the probable origin of the valley itself, and the fact that no important placer "diggings" have been found here, does not seem to favor the probability that these quartz veins will ever prove of much value. Between the present mill and the site of the old one, as well as at certain other localities in the valley, are springs containing various alkaline salts, from which the name "Salt Spring Valley" is derived.

Accompanying the copper formation of Copperopolis, and just west of it, is an immense body of serpentine, lying parallel with the general stratification of the slates, and traceable for miles along the valley by the openings made in it in the workings for copper. Opposite a point 1,000 or 1,200 feet northwest of the upper shaft of the Keystone claim, but on the southwest flank of the outlier of Bear Mountain, already noticed, is another heavy mass of serpentine. How far this extends in a northwest and southeast direction I do not know, as I have not followed its line of outcrop, but it is certainly not less than 1,000 feet in length.

[To be Continued.]

PAINE & STEVEN'S CONCENTRATOR.—The Nevada *National* says of this amalgamator, recently patented through this office, that the machine at the Banner mine, Nevada, took the tailings after they had passed through the rockers and 300 feet of sluices, and saved from the debris, which would have run into the creek and have been utterly lost, from seven to eight tons per month, which yielded over \$100 to the ton.

The Nevada *Gazette*, in speaking of the operation of the same machine, says: Some weeks since a machine was put up at the Eureka mill near Grass Valley, the company contracting to pay for the patent if they were satisfied with its work, after a month's trial. They had used it but a week when Mr. Watt informed the inventors that the machine came fully up to the representations of the inventors. The machine at the Eureka is the same size as that at the Banner, but has some improvements, and separated the sulphurets from the tailings of the twenty stamps of the Eureka mill, more effectually than any machine yet used. They are now putting in ten additional stamps at the Eureka, and Mr. Watt is of the opinion that one machine is all that will be needed for the thirty stamps, and one man can easily attend the machine. One of these machines has been in operation several months, at Virginia City, separating the sulphurets from the accumulated tailings of the Gould & Curry mill.

THE NEW FRENCH ARM.—There is at least plausibility in the story that one motive for the French "pitching in" to the Garibaldians near Rome was to test the efficiency of the Chassepot rifle. If those weapons were on trial in that encounter it must be confessed they stood the trial very well. The French lost two men killed and thirty eight wounded; while the loss of the Pontifical troops was small. On the side of GARIBALDI six hundred were killed outright, with the usual proportion wounded. Of course, considering the number engaged, the blow inflicted on the invaders of the Papal territory was terrible.

The description of how the Chassepot worked shows it to be a most effective weapon. A correspondent of one of the journals who witnessed the battle, says the report was so rapid that it sounded like the rumbling down of an alarm clock. The arm was discharged from eight to ten times every minute, and could be fired from twelve to fifteen times when the cartridges were held in the hand. The wounds mostly inflicted at short range, were severe, falling chiefly upon the breast, abdomen, thighs and knees.

FISH CULTURE.—The Eastern people appear to be alive to the necessity for restocking their rivers with food fishes. By experiments made in the Connecticut river, it has been proven that shad-eggs may be hatched in forty hours. A gentleman hatched by artificial means and placed in the river at Holyoke, last season, about fifty millions of young shad, accomplishing the whole work within three weeks and at a trifling expense. The whole country may, therefore, by artificial propagation and railroad facilities, soon enjoy the luxury of fresh shad, and at a moderate price.

A glass globe full of cold water, or even a ball of ice, will, in the sun's rays, act as a burning lens.

Manufacture of Sealing Wax.

Sealing wax, of which the chief ingredient is shellac, first came into general use in Europe about the year 1550. The Spaniards and Portuguese are supposed to have introduced it from India, and it was for a long time known as "Spanish wax." As, however, it contains no wax, this name was most probably transferred to it from some similar material used for the same purpose, the chief ingredient of which was wax. Numerous recipes are given for its preparation, which vary according to the color desired, or the purposes for which it is to be employed.

Mr. E. Prique, an occasional correspondent, has furnished us with some of the most approved recipes, as well as several interesting details in the process of this manufacture, as follows:

1. German method of manufacturing different kinds of red sealing wax of the finest quality: 4 parts shellac, 1 turpentine, 3 cinabar. Another—24 parts shellac, 10 Venice turpentine, $\frac{1}{2}$ Peruvian balsam, 16 einnabar.

Recipes for the more common sorts of red sealing wax: 18 parts shellac, 10 turpentine, 12 cinabar, $\frac{1}{4}$ mastic. Another.—4 parts shellac, 2 colophony, 2 turpentine, 4 cinabar, 3 chalk.

Recipe for the commonest kind: 40 parts colophony, 4 turpentine, 4 brown-red, 48 chalk.

Mode of Proceeding.—The shellac is first melted, either in a copper vessel or in a well glazed earthen pan, at the lowest degree of heat that will be necessary to melt it; at the same time constantly stirring it with a wooden stick. After this the turpentine is added, which has been previously warmed. When all is melted completely together the cinabar is added, or the mixture of cinabar and chalk. The heat must be neither too much nor too little, but just sufficient to allow a most thorough mixing of the different ingredients. When this is accomplished, the fluid mass is discharged into metallic molds and left to cool. The sticks of sealing wax have no polish. To produce this, they have to be heated again on the surface. For this purpose they are put in other molds, made of polished steel, which are engraved with the desired ornaments. These molds are heated only just sufficient to melt the sealing wax on the surface, by which operation the sticks obtain a beautiful glossy appearance.

For the purpose of molting the shellac easier, some add to the same a little alcohol. The heating of the molds to stamp the mark of the manufacturer, can be readily performed with a spirit lamp. To make common sealing wax appear to better advantage, the sticks, being still soft, are dipped in the powder of a better quality, and then superficially melted, so as to produce a thin coating.

2. Yellow sealing wax is made in the same way; but instead of cinabar, chrome-yellow is used. A very cheap one is made as follows: 4 parts white pitch, 2 mastic, 2 sandarac, 1 amber, 1 gum gutti.

3. Blue sealing wax: 16 parts mastic, 4 turpentine, 8 mountain-blue, 3 burned selenite. The mountain blue turns green by the heat of melting the mixture; therefore it is better to use fine indigo—or very fine Prussian blue can be used; but in that case the shellac must be particularly light-colored.

4. Green sealing wax is generally made by a mixture of yellow and indigo, and after the following recipe: 24 parts shellac, 12 mastic, 4 turpentine, 6 verdigris.

5. The best kind of brown sealing wax is made by mixing black and red sealing wax; or as follows: 32 parts shellac, 7 English earth, 3 turpentine.

6. Checkered sealing wax is made by mixing sundry pieces of different colors, to suit the fancy.

7. Gold wax is generally made by taking finely pulverized gold leaf or metal powder, and stirring them into the sealing wax instead of the colors. A common kind is made as follows: 6 parts shellac, 2 white rosin, 1 silver leaves.

8. For black sealing wax: 32 parts fine shellac, 16 bone black, 5 turpentine, $\frac{1}{4}$ storax.

9. Bottling wax, for closing bottles airtight: Melt 2 parts common wax; add 4 parts colophony and 4 parts pitch. When the mixture flows well, the corked bottles are dipped and turned around in the same. It is still better to add to the above mixture 2 parts shellac, which makes it less friable.

10. Soft sealing wax, for diplomas, etc.: 16 parts yellow wax; 3 turpentine, 1 olive oil: after it is melted, the cinabar, or any color is stirred in the compound.

Mechanical.

What is Mechanics?

The term "mechanics" is derived from the Greek word *mekhane*, signifying to contrive, to invent, to construct. It is a science in which are developed the laws of the phenomena attending or produced by means of the action of machines, or resulting from agencies such as are or could be employed in propelling machinery, and are hence termed mechanical. It is a science, having a breadth and scope quite equal to that of any other. To be a thoroughly educated mechanic is to be a scientist of the highest order. There is a class in the world which contemptuously sneers at a mechanic as one engaged in a calling inferior to many others; there is a still larger class which affects to make a broad social distinction between a *professionist* and a mechanical calling.

The primary meaning of profession, as applied to one's calling, embraces whatever business one professes to understand and follow; custom alone has excluded its application from mechanical business, merely to make an unnatural distinction between classes of men. Mechanics, when pursued as a study as well as a labor employment, is as much a learned profession as law, medicine, or philosophy. But what is mechanics? We will allow Professor Warren, of the Rensselaer Polytechnic Institute, of Troy, N. Y., to answer this question:

This is the point on which, without fault of their own, considering the limited instruction in it, and literature belonging to it, hitherto generally accessible in this country, more or less vague and inadequate views often apparently prevail among projectors of science, as well as, in a far greater degree, among many other people otherwise well informed.

But what is mechanics? Mechanics is a vast and splendid body of science, the central and dominant member of the entire body of engineering knowledge; and consisting of the statement, discussion and application of the laws of force. Furthermore, mechanics, thus broadly defined, exists in three successive natural stages, well named Rational Mechanics, Physical Mechanics and Technical Mechanics.

Rational Mechanics is the science of the action and reaction of pure forces, acting directly upon each other, under all possible conditions of intensity, direction and variation, and not acting in and through matter.

Physical Mechanics is the science of the same forces acting in and through matter, and as modified by the properties of matter.

Technical Mechanics, the last and highest stage of the science, is the science of force, considered as acting in and through structures which are assemblages of bodies of definite forms, positions and intended functions. It embraces, therefore, the theory and exact expression of the stability of structures of masonry, wood and metal, as walls, arches, domes and columns; also roofs and bridges of all varieties of design and material, and, in addition, the theory and exact expression of the dynamical efficiency of motors of every kind—locomotive, stationary and marine engines, vertical and horizontal water-wheels, the required or actual strength of boilers of any form or material, the mechanical resources of streams, etc.

All this, only briefly amplified catalogue of particulars, constitutes mechanics, and mechanics is immediately requisite in designing engineering works. Immediately necessary, I say; hence let us pry under and see what is *fundamentally* necessary.

Mechanics is the science of force, acting in space and time.

Force is a species of quantity.

Mathematics is the science of quantity.

Mechanics, therefore, is a branch of concrete mathematics, and of such rank that the problems which it presents are so numerous, and rise to so high a degree of complexity that their resolution demands all the aid which the resources of pure mathematics can furnish.

Such is mechanics, which, we repeat, is the principal member of the body of engineering science, and such the mathematical proficiency which, by inference, the knowledge of it is shown to require. * * *

Such a body of technical thought must now have its appropriate technical language wherein to express itself to those workmen who are to give tangible form to it.

CORRUGATED IRON FOR BOILERS.—Mr.

Richard Montgomery, of New York, has proposed the substitution of corrugated, instead of flat iron for steam boilers. He claims that scale will not be so freely deposited on corrugated as on flat iron, and that the additional advantage of presenting a greater heating surface in the same space will also be attained. He is also of the opinion that any ordinarily hidden defect in the iron, used for boilers, will be more readily detected in the severe test to which it will be applied in the process of corrugation. Iron is corrugated by passing a heated sheet of that metal between heavy fluted rollers. Corrugation adds greatly to its strength or stiffness; hence it is generally used in that form for building purposes. Corrugated boiler iron 3-16ths of an inch thick, has been known to resist a hydrostatic pressure of 160 lbs. without the aid of braces. Mr. Montgomery recently submitted the propriety of the employment of such iron for steam boilers to the Polytechnic branch of the New York American Institute, where it met with a lively and prolonged discussion; the chief objection being that corrugation deprives iron of its elasticity. The members of the Institute were quite divided in opinion with regard to the utility of Mr. Montgomery's proposition.

PLACING OF LARGE STONES BY THE ANCIENTS.—It is usually a matter of wonder to

modern mechanics that the ancients, destitute as they were of complicated machinery, should have been able to transport, raise, and place large stones, whether standing alone or as part of such buildings as the pyramids. The late discoveries at Nineveh fully expound to us the means of transporting large blocks; it was by placing rollers beneath. As to the means of raising, all we learn from Herodotus is, that it was effected by short pieces of wood. How so? The following suggestion in reply was made a few years ago by a gentleman named Perigal, before the British Association: Suppose a block has to be raised up along the pyramid, in order to be placed in one of the courses of masonry. It is brought by rollers to the base of the building. There all the rollers are removed except one near the center. One end of the stone being now depressed to the ground, a pile of slips of wood is placed under it, close to the center, this pile being rather higher than the roller, and terminating in one narrow piece at the top. The stone is now tilted so as to bring the other end to the ground. It is now possible to put a similar pile of pieces of wood underneath, close beside the first. On that pile, the block is tilted back to its former position, and so on till it is raised a little above the level of the next course of masonry. By rollers it is moved on to that platform, with a low pile of blocks once more near the center underneath. Then the process of tilting and raising is again gone through; and so on till it has been raised up to the level where it is to take its place in the masonry. By this simple process, too, says Mr. Perigal, a few men might have raised Stonehenge in a single night, if the requisite stones were prepared and placed in readiness near the spot.

RAILS DIRECT FROM THE ORE.—The *Stan-ton* (Va.) *Spectator* says that the success of the discovery for converting iron ore into cast steel by a single operation in an ordinary blast furnace, is now established beyond controversy. Rails are now cast from the ore, which prove to be cast steel rails of the best quality, flexible, tenacious, adamantine face, and of diamond hardness. It is impossible to calculate the magnitude of the value of this discovery.

FORGING BY PRESSURE.—The applications of this process are daily increasing in number, and in the generality of their employment, especially in England, as we learn from an authority thoroughly conversant with the subject. Thus the hooks and many other parts of differential pulleys are shaped, as also hammers and other similar instruments.

GRINDING with a cast iron wheel at high velocity is a process successfully conducted at many shops, and which has been found to be both economical and efficient.

The *Yorkshire Locomotive Works*, Eng., are announced as capable of building 400 locomotives per annum, or over one a day.

More than 1,000 farm engines are built annually in England.

Scientific Miscellany.

THE MOON NEAR THE HORIZON.—Messrs.

Wilson & Hood, of Philadelphia, have published a stereoscopic diagram, designed by Prof. C. F. Himes, the object of which is to illustrate the cause of the apparent increase in the size of the moon when it is near the horizon. The diagram consists of two figures on one, being a large circle with a smaller one concentrically placed, the other a large circle exactly like the former, having within it, however, two small ones equal and eccentrically placed at an eighth of an inch right and left of the center. When viewed in the stereoscope, this gives the impression of a large circle on the surface of the paper, a small one back of the paper, and a yet smaller one between the paper and the observer. The actual size of these latter circles must be the same, since they are each formed by the union of the small circle of one figure, with one of the small circle of the other; but since the one seems to be further off than the other, we instinctively assign the greater size to that which seems to be farthest off, and yet subtends an equal angle. Thus it is with the moon when near the horizon. Comparison with surrounding objects causes us to assign to it a greater distance, than when it is near the zenith, and thus in turn to consider that it is larger.

A NEW DRIFT THEORY has been proposed, to account for the drift of the glacial epoch, in which it is held that continents have not been depressed, but rather overflowed by the ocean. This theory is founded upon another, recently promulgated, that owing to the precession of the equinoxes the mass of water is transferred from one hemisphere to the other once in about ten thousand years, during which period the sun remains eight days longer in one hemisphere than in the other. At the present time the winters of the southern pole are eight days longer than with us; the ice continent has consequently formed there, and the mass of the ocean is to be found in the southern hemisphere, and the ice covers a space upon and around the south pole more than twice the area of all Europe. The extreme of cold at the Antarctic pole is supposed to have been reached in 1248, since which time the climate there has been becoming milder, while ours north of the equator has been gradually growing colder, and in the course of ten thousand years we shall be in the same frigid condition that now exists in the Antarctic, or as existed with us ten thousand years ago. Of course such a constant moving backward and forward of the oceans of the earth, would be all sufficient to account for the vast amount of ancient drift, which is noticeable in various parts of the earth; but probably no where more so than in California.

MEALY AND WAXY POTATOES.—An examination of the potato with a microscope has, at length, proved the relative worth of the mealy and waxy kinds of this useful vegetable. On examining a thin slice, it is seen to be almost entirely composed of cells, which are sometimes filled with, and sometimes contain clusters of beautiful little oval grains. These grains remain unchanged in cold water; but when it is warm they dissolve in it, and the whole becomes a jelly, and occupies a larger space than it did in the form of grains. When a potato is boiled, then each of these cells of which it is composed becomes a little vessel full of jelly; and, if there be not a great quantity of starch in the cells, it may be gelatinized without bursting them. But, if the number of grains or their size be very great, the cells of the potato are broken on all sides by the expansion of the little masses of jelly, and the appearance of mealiness is produced. Hence we see that mealy potatoes are the most valuable, and waxiness denotes a deficiency of starch or nourishing matter.

The steam which is seen to issue from the spout of a tea kettle is no hotter, as measured by a thermometer, than the boiling liquid within; yet when condensed in a body of cold water or ice, it gives out as much heat as one thousand times its weight of boiling water would do.

EFFECT OF HEAT UPON BUNKER HILL

MONUMENT.—In swinging a pendulum in the shaft of Bunker Hill monument, it is found that the ball of the pendulum, when at rest, is not always over the same point in the floor. This fact is due to the unequal expansion of the sides of the monument, in consequence of unequal exposure to the sun. On days when the sun is obscured by clouds, no motion of the ball occurs. On one occasion, during a sudden shower, accompanied with strong wind from the southeast, the ball moved in the space of a few minutes a quarter of an inch to the eastward. Observations were recorded through several weeks, and no doubt remains that a cause coincident with the sun in its progress produced the variations of the perpendicular in the monument. Another interesting fact is recorded. The extreme departure of the ball from the center is to the west of northwest; not to the north, as might at first glance be supposed. The explanation is found in the position of the monument. Its sides do not face the cardinal points, but are inclined about 20°. The expansion of a single side would produce inclination in a direction perpendicular to the side. The expansion of two adjacent sides would produce inclination in the direction of the diagonal. The greatest diameter of the irregular ellipse, described by the index in twenty-four hours, is ordinarily less than half an inch. The heat of the sun penetrates to but a moderate depth. This is evident from the prompt retrogressive movement of the column when a shower falls only upon the more highly heated sides.

SMOKE FROM GAS-LIGHTS.—It is pretty

generally imagined that the smoking of ceilings is occasioned by impurity in the gas, whereas, in this case, there is no connection between the deposition of soot and the quality of the gas. The evil arises either from the flame being raised so high that some of its forked points give out smoke, or more frequently from a careless mode of lighting. If, when lighting the lamps, the stop-cock be opened suddenly, and a burst of gas be permitted to escape before the match be applied to light it, then a strong puff follows the lighting of each burner, and a cloud of black smoke rises to the ceiling. This, in many houses and shops, is repeated daily, and the inevitable consequence is a blackened ceiling. In some well regulated houses, the glasses are taken off and wiped every day, and before they are put on again, the match is applied to the lip of the burner, and the stop-cock cautiously opened, so that no more gas escapes than is sufficient to make a ring of blue flame; the glasses being then put on quite straight, the stop-cocks are gently turned, until the flames stand at three inches high. When this is done, few chimney-glasses will be broken, and the ceilings will not be blackened for years.

A NEW METEORIC THEORY.—Sir John

Herschel has recently advanced the theory, not wholly new, but never before supported by well known facts, that meteoric showers are simply the light caused by the collision of the earth's atmosphere with the tenuous substance of a comet. Prof. Adams, who shared with Leverrier the credit of discovering the planet Neptune, not only accepts this theory but attempts to establish the identity of the comet through which the earth recently passed with Tailor's comet, whose orbit apparently coincides with that which, if a comet, the recent visitor would have taken. Those who have read Professor Tyndall's work on heat may find in this theory an additional reason to accept the learned writer's hypothesis as to the origin of the sun's light and heat.

A NEW IDEA.—Dr. Hayes, in his lecture on the Arctic regions, recently made the interesting statement that he had seen an iceberg so large that, if it were brought to New York and sold by the pound at the market rates, the proceeds would more than twice pay the national debt. The Doctor is no doubt a reliable mathematician, and his discovery is commended to the notice of the Secretary of the Treasury. The Great Eastern might be chartered and sent to tow the icy treasure into market, and Jay Cooke would undoubtedly take the job of converting it into greenbacks. The project is certainly an ice one.

WARMTH OF THE SNOW BLANKET.—Much

controversy has existed as to the warmth imparted to the earth by a covering of snow, until M. Boussingault, during the winter of 1841-2, found that a thermometer plunged in snow to the depth of a decimeter (about four inches) sometimes marked nine degrees of heat greater than at the surface.

California Academy of Sciences.

REGULAR MEETING.

MONDAY EVENING, Jan. 20, 1868.

Prof. Whitney in the chair.

The action of the Council in declining an offer to exhibit the Academy collections at the City Gardens for \$100 per month, was confirmed.

A motion was adopted to print 500 copies of the new constitution, list of members, and annual address of the President.

It was stated by the President that the Council had appointed Mr. Bloomer Curator of Botany.

PUBLICATIONS.

The contribution of several publications was announced, including a history of fishes in Massachusetts, Kustel's new work on the treatment of ores, and a fine photograph of the skull of the Siamese Tiger from Boston. Copies of the second printed memoir of the Academy were distributed to members. It is an original paper by Baron Richthofen on the Natural System of Volcanic Rocks, comprising ninety-four pages.

FAUNA OF CALIFORNIA.

Dr. Cooper read a paper entitled *Additions to the Fauna of California*, giving notes of animal species recently determined to exist on this coast. Among these he enumerated one sea elephant, as large as a walrus, resembling the sea elephant of Cape Horn. It has been nearly exterminated by the seal hunters. Two species of seals have been identified, and three of the sea lion are enumerated, but there may be only one true species. There are sixteen species of bats in California, two of which are very large and curious. Two or three species of rodents have lately been added to the California list, including a link between the rat and rabbit, which is found in the Alpine region of the Sierra Nevada. A large flying squirrel has been found here, specimens having been produced from Mendocino and Sonoma, as attested by several members of the Academy. The same species was previously known in Oregon. The species of the cetacea, or whale family, have never been worked up; but ten are enumerated, and two or three others are reported. Of birds, quite a large number of species have been added, including the yellow crooked Arctic woodpecker, two new species of the humming-bird, several graminivores, a black hawk—the first found in the United States, a small owl, the pied oyster catcher, several snipe, two of the rail genus, yellow and black; the European widgeon, a straggler from Asia; the short-tailed albatross, the frigate pelican—which is rare north of the tropics; a large and entirely white gull, of a species not found but once before in the United States; the forked-tail petrel, from San Pedro, and the black petrel, from the Farallones; two species of puffin, and a white-bellied ork. Several of the above species were first identified and described by Dr. Cooper.

NOTES ON ALASKA.

T. A. Blake, of the recent scientific expedition to Alaska, read some interesting notes on the topographical and geological features of the northwestern coast. Like other continental coasts in high latitudes, north and south, this is bordered by high mountain ranges, and presents a most intricate and rugged shore, though grander than some others cited. This is mainly due to the mighty erosive action of glaciers, the formation of which is the natural result of atmospheric humidity and low mean annual temperature, due not only to geographical position, but to high elevation. The published and glaringly inaccurate charts of the northwest coast, north of Vancouver Island, fail to give an adequate idea of the vast archipelago of islands and network of channels with which the whole coast of British Columbia and that of the lower and eastern part of Alaska, below 59°, are fringed. The Straits of Fuca are the southern point of this complex system of labyrinthine channels, which afford peculiar facilities for inland navigation. After describing graphically the bold and picturesque shore lines of this region, and of Washington Territory, with its snow peaks rising from 8,000 to 11,000 feet above the sea, Mt. Baker being the highest, and mentioning the mild climate of Victoria, which shows a mean annual temperature of 50° and about 200 fair days, Mr. Blake sketched the appearance of the coast further north. Reaching Sitka Island, he described it as a mass of unexplored rugged mountains, many of which are capped with eternal snow. The town (a good drawing of which he exhibited) is situated at the head of Sitka Bay, the entrance to which is marked by the symmetrical volcanic cone of Edgecomb, the second of a series of volcanic peaks

bordering the coast and culminating in Mount Fairweather and St. Elias, the heights of which are variously stated. The latter is visible in clear weather at a distance of 150 miles. The rock in the vicinity of Sitka is a hard grit, sometimes coarse, often passing into digillite. The trend of this formation seems to be parallel to that of the coast. It extends as far south as "the deep sea," a remarkable fresh water lake, twelve miles southwest of Sitka, on the opposite side of which syenetic granite occurs. Limestone, highly crystalline, is found north and within a few miles of the town. The vegetation and general appearance of the coast is very similar to that southward, though the beautiful Sitka spruce, which is remarkable for its grace and the mathematical regularity with which its branches grow from the central stem, replaces the Douglas spruce of lower latitudes. Trees grow to large size, many being seen from six to ten feet in diameter. Little was known of the geology of the country. It is only along the shores that the rock can be investigated. The roughness of the country, and thick growth of timber, and masses of fallen and decaying trees covered with thick moss, always saturated with water, almost preclude geological investigation. Mr. Blake said he had yet to learn of a man, white or Indian, who had crossed from one side of Sitka Island to the other, a distance of not over twenty miles in some places. Russian meteorological observations show, as a mean of twelve years, the mean temperature to be about 42°, the extremes being very small. The same observations show a mean annual rain fall of 83.3 inches, the maximum being 105 inches. Along Chatham Straits, east of Sitka, the rocks are metamorphic, stratified mica schist, standing almost vertically, and showing a parallelism in their trend to the line of the coast and of upheaval. Glaciers are common along the inland waters north and back of Sitka Island. Three of these sweep grandly from the mountain gorges and rush to the water's edge, generally terminating in a low crescent-shaped flat, formed by the wash from their terminal moraines. In Icy Straits, north of Sitka Island, the ice from them falls into the sea, and so great is the accumulation as to render navigation dangerous. In latitude 59°, along Chatham Straits, every marked depression has its glacier of greater or less extent. These glaciers are to be seen at points as far south as the mouth of the Stikkeen river, and the lowest known limit on the coast is about latitude 54° in British Columbia, east of Port Simpson.

At the head of the Peninsula of Alaska is the commencement of another great line of volcanic action, which extends to the southwest, forming the peninsula, and then curving to the westerly the long chain of Aleutian Islands, stretching far towards the Kamtschatka line, stepping stones, as they have been aptly called, between the two continents. The rocks on the Island of Kodiak, east of the peninsula, metamorphic slates and sandstones, also show a general parallelism in their trend to that of their line of upheaval, trending N. E. and S. W. instead of N. W. and S. E., as on the coast of the mainland.

During the time spent by the recent expedition at Captain's Bay, Island of Ounalaska, Mr. Blake, Dr. Kellogg, and two of the officers of the Lincoln, made the ascent of Makuskin, an active volcano on the northern end of the island. The height was determined approximately at 5,600 feet, that of the snow-line at 3,168 feet, that of no vegetation at 2,500 feet, except the "red snow," which occurred at from 4,000 to 4,500 feet. An incipient glacier curves gracefully around a gorge on the east flank of the mountain. This island is marked by the entire absence of trees, though the hills are covered with a thick growth of grass. It is apparently almost wholly made up of volcanic rocks. Perhaps the most remarkable view of volcanic cones and peaks, snow-covered and rising from the sea, to be found in the known world, is that of Uinak Island, with its volcanic peaks of Shihaldin and Pogromaja, both conical peaks of unbroken symmetry, rising to heights of between 9,000 and 10,000 feet. Between them is Destruction Peak, comparatively low and irregular in its outline, showing it to be a volcano in its early stage of development. In 1863, its eruption caused the loss of many lives, and hence its name. The mountains are entirely snow-covered, and between them are vast fields of snow. Only in limited areas along the shore is snow absent. The angles of slope vary from 30° to 35°.

Mr. Blake confirmed previous statements as to the meagre knowledge of Alaska mineralogy. Good coal and paying quantities of gold are yet to be discovered. Copper

abounds on the dangerous Copper River, and magnetic iron ore and galena are reported. Fossils of the carboniferous age occur at Cape Beaufort on the Arctic coast, of the jurassic period on the east coast of the peninsula, tertiary fossils on Kodiak Island, and several other points.

At the close of Mr. Blake's interesting paper, Dr. Kellogg exhibited specimens of Siberian plants, interesting from their connection with the botany of our Northern Territory, with which they meet and mingle. Among the most marked species were forms of *Rhododendron*, from Ounalaska, of *Campanula*, *Topelia* and *Linnaea borealis*, besides a new species of the gooseberry family, combining in its fruit the qualities of the gooseberry and currant.

MISCELLANEOUS.

Prof. Whitney read an interesting paper on the method pursued by the Geological Survey in the naming of mountain peaks in California.

Dr. Cooper asked if the well-known muskrat of the Atlantic States had ever been observed here. Beavers are plentiful; but he had never met the muskrat, and had observed that where one of these animal tribes abound the other was scarce, the heavier being the deadly enemy of the muskrat. The latter is found in Oregon, but the beaver is the most plentiful.

Dr. Kellogg presented 100 models of crystalline forms, a gift to the Academy from Mr. Moore, late of Virginia City.

A CALIFORNIA INVENTION TO BE INTRODUCED.—Robert Kollett's ticket punch is to be introduced upon all the San Francisco city railroads on the first of February. From and after that date, single tickets, good for four trips, will be issued. At the first, second and third passage, the ticket will be presented to the conductor, who will punch a hole in it and then return it to the passenger. On the fourth passage the ticket will be delivered up. The punchings are preserved in a locked chamber attached to the key, which is opened only at the office, where the punchings are counted and employed as checks against mistakes or dishonesty on the part of conductors. This check punch is a California invention, and was patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

WATER METERS.—Fifty-six million gallons of water are daily brought into New York city by the Croton Aqueduct, one-half of which is said to be wasted. The Water Board are going to introduce water meters in all places using water, and charge by the quantity. Such should be the practice of every water company.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

BAY CITY HOMESREAD ASSOCIATION.—Jan. 21st. Capital stock, \$22,500.

MECHANICS' MILL ASSOCIATION.—Jan. 20th. Capital stock, \$40,000; 400 shares, \$100 each. Trustees: A. W. Jee, William P. Cantrell, George R. Jessee, M. Russell and J. Kendall.

ELECTION OF OFFICERS.—KEARSARGE MINING CO.—Jan. 20th. Trustees: Nathl. Page, Thos. Sunderland, Geo. Stead, Wm. N. Wade and E. B. Mott, Jr. President, Nathl. Page; Secretary, T. B. Wingard.

THE PIONEER OIL MILL of Salem, Oregon, made its first oil on the 6th instant. The machinery of the mill is similar to that used at the oil mill at the foot of Third street in this city. Oil is used in the hydraulic press, instead of water, for expressing the oil from the crushed seed.

MERCANTILE LIBRARY ELECTION.—The annual election of officers of the Mercantile Library Association was held on Tuesday last. Only 174 votes were cast, 11 scattering; the rest were all for the ticket which was elected: President, Robert B. Swain; Vice President, William H. L. Barnes; Corresponding Secretary, David Wilder; Recording Secretary, Thos. R. Hayes; Treasurer, William C. Ralston; Trustees: William G. Badger, J. McNulty, Henry Neustadter, William Ashburner, Morris Mayblum, A. B. Forbes, Arthur M. Elbets, William E. Wood and F. B. Reynolds. Work on the new building is progressing rapidly, and it is thought it will be ready for occupation by April next.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

72,581.—IMPROVEMENT IN BOXES FOR GAUGING SHINGLES.—John W. Alesworth, Santa Cruz, Cal.:

What I claim is a gauging box for shingles, constructed with the sides, B, with their graduated steps, b, b, b, together with the movable box, D, and bar, F, substantially as and for the purpose described.

The object of this invention is to provide a gauging machine for straightening and gauging the edges of lumber, such as boards, planks and shingles, but more especially the latter, after they have been split and shaved. The device by which this is accomplished, consists of a platform mounted on legs, and having side boards with graduated steps at each end. A box of the desired length, with top and bottom removed, is placed upon the form between the side boards, and is provided with a transverse screw for pressing the shingles together. In order to level pieces of boards or planks, false bottoms are employed, having the necessary beveled grooves. The false bottoms are raised as is necessary, by head pieces having pins in them.

72,687.—IMPROVEMENT IN SOLAR AND TRANSIT INSTRUMENTS.—William Schmolz, San Francisco, Cal.:

What I claim is the hour circle, d, fastened upon the base, P' A', with a solar apparatus attached upon the axis, P, in combination with a surveyor's transit, substantially as described and for the purposes set forth.

The object of this invention is to provide surveyor's transit instruments with a solar attachment, the two being combined, so that the operator is enabled to find the longitude, latitude, true meridian, hour of the day, the sun's declination, and the variation of the magnetic needle; the whole forming a part of and attached to one and the same instrument.

RECENT INVENTIONS.

GOLDEN INK.—A gentleman in Mississippi is said to have invented a golden fluid, which, if used as an ink, will present the same appearance as writing, executed with common ink, does when it is dashed with fine gold dust before drying. It is said to form a singularly brilliant, chemical writing fluid. The happy inventor is said to have made the discovery while compounding a wash for the cure of cancer. He says the colors are permanent, and that the ink will become a favorite with printers and sign painters.

A NEW SHINGLE MACHINE.—The Vancouver Register describes a new shingle machine, the invention of Mr. I. I. Lancaster, of that place, which is believed will prove to be of superior excellence. The Register says it is a hand machine, intended to be operated by a lever, and is calculated to cut a shingle every second, or rather a piece wide enough for three shingles every second. Allowing reasonably for accidents and ordinary waste of time, it is perhaps safe to estimate its capacity at a shingle per second. It will whittle down our forests of cedar at the rate of 36,000 shingles in ten hours.

A "SAILING CARRIAGE."—The St. Louis Democrat describes a newly invented "sailing carriage," designed for use on the New Mexico route: It has two upright jib sails, and a sail on each spoke of the two wheels on one side of the wagon, with steering gear acting on the forward wheels, and provision for transferring the wheel sails to the opposite wheels. The inventor is a German, who has been a sailor, and has since spent several years in traversing the plains. He relies for its practicability upon the constancy of the prevalent winds on the plains. The wheels are ten feet high, the wagon body shaped like a long boat and hug low. The whole concern presents an odd and formidable appearance. The design is to take passengers and mail matter only—not freight—and it is expected that the carriage will suffice as a boat in crossing streams.

NEW CALCULATING MACHINE.—Samuel J. Kelso, of Detroit, has received a patent for a machine which can be used for adding, subtracting and multiplying figures of any desired magnitude, with the greatest ease and facility.

Weekly Stock Circular.

Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,
January 25, 1886.

Mining Share Market.

We report a very active market during the period under review, and also a very general advance in several leading stocks over prices which obtained in the previous week. The inclemency of the weather has greatly interfered with milling operations, in a great measure preventing the hauling of ores and otherwise retarding their reduction as well as production; however, this did not prevent some very important developments in various claims, particularly the Hale & Norcross, at their lower depths. At the close, the market is less firm, and prices a shade lower.

The following table shows the bullion product of the leading claims on the Comstock Lode during the year 1885, as compared with 1884:

COMPANY.	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	Total.
Hale & Norcross.....	\$102,571 72	\$117,650 44	\$73,144 02	76,327 88	\$100,258 88	\$117,728 23	\$123,806 17	\$124,654 69	\$120,250 29	\$140,900 00	\$151,653 81	\$141,257 55	\$1,007,297 45

tion, south mine, 476; and 4th station, south mine, 21 tons of ore. A dispatch of the 24th inst., states that the north drift, on the fourth station, is in four feet of ore, and looks very promising in going north.

YELLOW JACKET—was in the market at \$289.750, then sold at \$230, and closed at \$224. An assessment of \$125 per foot was levied on the 22d inst. The prospect says that the pump is being let down, and the shaft is to be sunk an additional depth of 200 feet. The winze on the Kentuck line is down 170 feet in good ore, and the next station will doubtless develop a fine body of ore. At present, but little ore is being mined.

The bullion product of the Yellow Jacket Claim has been estimated for the last six months of 1885, we having been unable to obtain the figures from the office of the company at Virginia. The following table shows the yield of the various companies for 1886:

COMPANY.	January.	February.	March.	April.	May.	June.	July.	August.	September.	October.	November.	December.	Total.

DURING THE YEAR 1886.

KENTUCK—was quite active at \$275. Nothing new from the mine. The receipts of bullion to the 18th inst., foot up at \$14,894.

IMPERIAL rose from \$170 to \$190, and closed at \$188. Both mines of this company are yielding the usual quantity of ore, but they experience considerable difficulty in carrying it to the mills, on account of the bad roads; the mills, however, have a full supply of ore at present.

OPHIR—declined from \$70 to \$62.50, advanced to \$70.30, and closed at \$67.50. An assessment of \$3 per share, or \$36 per foot, was levied on this stock on the 20th inst. GOLD & CURRY advanced from \$380 to \$430, and closed yesterday at \$420. They have ceased extracting ore from this mine for the present. The office of this company is now located in Stevenson's Building, on Montgomery street.

EMPIRE—was in the market at small extent at \$180. BELCHER sold at \$180.170, then at \$165, and at the close \$160 is bid. GOLD HILL QUARTZ realized \$200.35. SIERRA NEVADA receded from \$24 to \$22, and closed at \$21. EXCEQUER rose to \$33, and closed at \$31. A few shares of CONFIDENCE sold at \$37.50, and BULLION at \$37, closing at \$35.

The sales in the Regular Board during the past week aggregate \$1,871,145.

National Mineral Land Law, Instructions.

Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

CHOLLAR-POTOSI—was less active than during the previous week, opening at \$186, improving to \$230, then selling at \$200.225, and closing at \$216. During the week ending January 16th, the New Santa Fe gold yield 30 tons of ore, and the Santa Fe third 525 tons, showing average assays from car samples of \$28 and \$32 per ton respectively. The various mills employed by this company have taken 551 tons of ore during the same period as stated above, leaving at the dumps 2,443 tons. At the new shaft the north drift is being continued, having nothing but porphyry in the "face."

SAVAGE—continues the most active stock on the list, and sold at a marked advance, improving from \$120 to \$152, and at the close realizing \$146. During the week ending January 15th, 1,034 tons of ore were extracted, showing an approximate value of \$35,632, or an average of \$34.46 to the ton. This amount was taken from the following points: 2d station, north mine, 73; 3d station, north mine, 464; 3d sta-

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

Notwithstanding the bad effects of the late storm, which swept the coast, and in its course laid waste the fruits of mining labor, we are pleased to learn that work is being, and will be, resumed on most of the claims. Some claims perhaps will require months to again get in proper working order; but there is no doubt but that the interest and future prosperity of our State demand that the work of opening up our extensive placer mines and the careful and prudent working of our quartz ledges should go on, let come what will. It was our mines that first brought us out of a state of nature and made us a populous State. They have been to us what bread is to the hungry man, and all that is necessary for us to do to concentrate in our midst a great mart, from whence the produce of the nation, and perhaps of many nations, will be distributed all over the country, is to see that our mines are properly worked. Storms will come, and, in the nature of things, it is to be expected that damages will occur to everything exposed; and the only way to treat such affairs is to go immediately to work and refit what has been injured. The interior papers are constantly filled with reports of new discoveries. In Idaho, the mines are doing well, and silver bricks are being turned out at Warren's Diggings. In Oregon, there has been new discoveries near Jacksonville, and also in the more eastern portion of the State. Montana also reports new discoveries, said to be quite rich; also Utah, Dacotah and New Mexico; while we in California and Nevada report almost daily the discovery of rich quartz ledges; and altogether we may consider that mining all over the coast, in all its branches, is in a very healthy condition.

CALIFORNIA.

Alpine County.

Miner, Jan. 11th: A new strike is reported in the I. X. L. Co's mine. The Tarshish is showing ore at every step. We learn that they have struck a large deposit of the rich, soft or sack ore in the Tarshish shift, from which 24 sacks have already been taken, and lots more in sight.

Amador County.

Ledger, Jan. 18th: The Coney & Bigelow mill having been put in complete repair, will commence crushing next Monday. During the past two months a new and much larger boiler has been put up in place of the old one, and many other important repairs have been made. They have a fine lot of rock on hand, and from this time on it will be kept in constant operation.

Butte County.

Oroville Record, Jan. 18th: The large frame building, known as Whitaker's mill, on the Barum claim on the Blue Lead, collapsed under the pressure of snow, and now lies a total wreck. The machinery must necessarily be more or less damaged. Kendall, Vail & Co. have four stamps running regularly and paying very well.

The Cherokee Flat correspondent writes: The miners are taking advantage of the water. As to mining, so far it has been a glorious season. No one who has been willing to work, has laid by from necessity. Harris & Co. have been running day and night; so has Powers, using Harris & Co's water; but their reservoirs are about empty. The Cherokee Co. have in their reservoirs some 20 days' run, and are employing about 30 men. As to clean ups, that is not thought of as long as water lasts; but as the diggings have been worked so long, the owners can pretty well guess how they will pay, by the amount of dirt run off.

Calaveras County.

San Andreas Register, Jan. 18th: C. V. McNair, one of the owners of the Washington, says that the amalgam recently taken from that claim, [of which we gave notice,] was taken from only 12 tons and 700 lbs., and that the returns from San Francisco shows a yield of \$992 instead of \$882.

From persons recently from Camanche, Frankfort and Haightville, we get the following items: There are about 300 white and 200 Chinamen at work in that locality, where they can get water from the pipe. Nearly all the claims are paying—the best ones averaging \$7 or \$8 per day to the

hand. Wm. Leonard's claim paid \$22.50 for the last week, over all expenses and wages. The German claim, worked altogether by the Germans, paid \$250 the last week; David Jenks' claim paid \$25 more than expenses and wages; Zimmerman's, Cohnrn's and the French claim—all hill claims—each paid about \$8 per day to the hand. There are a large lot of claims with no water. The owners are digging their side ditches, and will probably be at work in two weeks, provided they can obtain water from the ditch. Mr. Marey buys about \$2,500 worth of dust per week, and he purchases about one-half of the dust offered for sale in Camanche. The Supt. of the ditch—Mr. Mackey—received about \$700 in cash for water last week.

Kern County.

Havilah Courier, Dec. 21st: Work on the Belmont mine, Washington district, will be resumed next week. The mine has been purchased, or a greater portion of it, by other parties, and the prospect is that the Belmont will yield a rich reward to the proprietors.

Last week's item, alluding to the St. John mine, at Sageland, was incorrect as to the amount; it should have been \$10,000 instead of \$5,000. McKeadney's mill is at work constantly, crushing ore from the Delphi mine, which yields very well.

Mariposa County.

Mail, Jan. 18th: Mining interests in Cathey's Valley are flattering. Thos. Kendall's quartz lead has been paying finely for some time past. He has now leased the claim and the use of his two anastars to a party for one year, at \$75 per month. Mr. K. has another lead which he intends prospecting.

The resident managers of the Mariposa Co's estate evince a disposition to do business in a business way; and though they go a little slow, we are convinced that when operations commence, they will commence on a solid and permanent basis. Work will be resumed at the Benton mill, without reconstructing the dam, carried away by the late flood. A ditch will be dug from an available point instead, for the purpose of supplying water for the mill.

Nevada County.

Gazette, Jan. 21st: We were shown a day or two ago the drawings for a new 10-stamp mill, to be erected at Kate Hays Flat, near French Corral. The claims were purchased a few weeks ago by Messrs. Coleman, Crittenden and Paulinier, and the contract for the machinery has been made with the Nevada Foundry. The mill will be run by water, and they expect to have it in operation by the middle of March. The cement claim is situated in an ancient river channel, is from 100 to 150 ft. in width, will average 10 ft. in thickness, and is 600 feet in length. The bed of cement has been prospected in different places, and quite thoroughly, and has given various yields, ranging from \$26 to \$60 per ton. The surface ground has been sluiced off by the hydraulic, and the cement can be taken out and delivered in the mill at a trifling cost.

The mill of the Banner Co., which suspended operations for a week or two, was started up again on Monday. They anticipate no difficulty hereafter in keeping their 20-stamp mill in constant operation, and in addition will probably furnish a large supply of ore for estom mills.

Transcript, Jan. 17th: O. Palmer and Sam. Everingham are going to remove the machinery of Palmer's mill from this city to Graniteville in the spring, and put up a custom mill there. A great deal of prospecting is being done in that vicinity.

Jan. 18th: Hydraulic mining throughout Little York township is pretty generally suspended in consequence of the breaking of ditches. The William's ditch has a little water which comes in below the head of the cañons, but none others are running water. Men are examining the extent of damage done the ditches, and it is not known how soon mining will be resumed until they report.

Ennis & Co. are working a cement claim, located on Greenhorn, north of Red Dog. They prospected all summer, and found encouraging indications. They have opened on the channel by a tunnel, and have made two clean ups, which were in every respect satisfactory. The parties consider their mine excellent.

Jan. 19th: A company of Chinamen, mining at the headwaters of Diamond Creek on the ground upon which the old Union mill formerly stood, made a rich strike a short time since, and are now taking out from \$8 to \$10 per day to the hand. White men have been working in this locality for years, but none supposed the ground to be worth washing.

Grass Valley *National*, Jan. 17th: The old Alta hoisting works on Alta Hill, fell down this morning from the pressure of snow.

Jan. 20th: The 30-stamp mill of the Eureka Co. is now in operation, and works satisfactorily.

At the North Star Co's works at French Leap, last evening, the "bob" connecting with the pump rod gave way, and put a stop temporarily to pumping operations. The breakage, however, will be repaired, and pumping resumed this evening. The mine continues to yield rich rock in quantity sufficient to keep their 16-stamp battery in constant operation.

The Boston Mill Co. is about to erect a mill on their mine in Washington district, in this county.

The Empire mine continues to yield rich specimens daily.

A party of youngsters have been engaged for some time past in picking up float quartz and crushing it in a hand mortar, and some of their crushings have yielded at the rate of \$1 per hour for the time employed in the operation.

Siskiyou County.

Yreka Union, Jan. 11th: Messrs. Genner & McConaughy have been prospecting some ground between Rough and Ready and Athena with very flattering results, and their success has excited a good deal of interest in prospecting in that section. There are many points along the western skirts of Scott Valley where thorough prospecting would develop good diggings which would furnish remunerative occupation to hundreds and perhaps thousands of men.

Mr. S. S. Richardson, formerly superintendent of the London Quartz Co., on Indian Creek, in this county, is at present engaged in bringing water on to one of the high bars of the Klamath in the vicinity of Happy Camp. He has completed the survey of the ditch, and will commence to dig it in February. It will take water from Elk Creek five miles from its mouth and carry it to a bar on the Klamath three miles above the junction of that stream with the Klamath. It will require years to work the bar out.

COLORADO.

Register, Dec. 31st: Thirty pounds of ore from the Comet lode, Griffith mountain, recently yielded at the rate of \$455 per ton.

C. J. Goss has discovered a new lode just below the Lily. Fred A. Clark showed us 10 ozs. of silver that he extracted from 25 lbs. of the ore without a crucible.

Five tons of first-class ore from the Young America lode is being treated at Garrott, Martine & Co's, in Georgetown, three tons at the California Reduction Works, and a quantity at the works of Mr. Kinney, lately started at Mill City. We were shown at Messrs. George T. Clark & Co's two bars taken out by the California Reduction Co. from this ore. The ore was of the second class, and assayed \$154.97 per ton. From 2½ tons the result was \$342 coin.

Mr. Conlee cleaned up 161½ ozs. of gold from his last week's work.

Mr. Tenuel informs us that they have cut the same stratum of ore in the Smith & Parnelle pump shaft, at a depth of 450 ft., that the Black Hawk Co. have been doing so well with the past year.

Mr. John Collom, of Bear creek, Snake River district, recently made assays of lead reduced by him—60 percent. of the dressed mineral—and found the value \$450 per ton after deducting the lead contained in the litharge used. He uses the Scotch hearth and the Collom separator.

Fred A. Clark, with five teams, carrying six tons of ore from the Terrible lode, came through town yesterday, en route to the California Reduction Works. It was as pretty ore as we ever saw, chunks weighing 100 lbs. being not uncommon. It cost about \$30 a ton to mine, \$5 to pack down to the wagon road, \$25 to haul to Black Hawk, and about \$100 to work, making the entire cost \$160 per ton. Yet the owners expect to make money in the operation.

Letter from Oro City, Dec. 16th: The promise of lively times in this section next season is good. A few of the property holders of Granite have entered into an arrangement with a Mr. Hayden to furnish a mill for an interest in some of their lodes. They have got their mill on the ground and in process of erection, and will have it running by the first of May next, it being the pioneer mill of Lake county.

Denver *News*, Jan. 1st: We were shown yesterday by Mr. Curtis, a "button" from the Goss lode, Georgetown, valued at \$13.93. This was assayed from 25 lbs. of ore.

Georgetown *Miner*, Jan. 2d: Messrs. Scott & Packard have discovered a new lode on Columbia mountain, about 100 ft. above the Monticello, that they are now actively developing. It is said to be looking well.

We learn that it is probable that the erection of extensive reduction works will be commenced here soon.

Garrott, Martine & Co. have taken out and shipped during the week 1,242.90 ozs. of silver bullion, coin value \$1,452.61.

Shaft No. 3, east, on the Hunkadora lode, is now down to a depth of 100 ft., it being the deepest shaft in this district. The crevice is now 8 ft. between the walls, and the ore vein full 3 ft. in width.

We recently visited the Young America lode. Discovery shaft is 26 ft. in depth, and 60 ft. east is another shaft 33 ft. deep. From the bottom a drift has been run 20 ft. east. About 15 ft. from the surface another drift has been run a distance of 15 ft., and in this the full crevice sparkles with rich mineral. From this shaft to the end of the 1,500 ft. east of discovery, the crevice is developed every hundred ft., and 1,200 ft. east a shaft 8 ft. in depth has been sunk, showing the crevice at this point 8 ft. in width.

DACOTAH.

Reese River *Reveille*, Jan. 11th: We are in receipt of a communication from "Miner Boy," dated the 1st inst., concerning the Sweetwater district, giving an account of late discoveries of rich quartz and placer mines. The letter appears to us to have been written in a spirit of careless extravagance, to say the least. All the surroundings of the district are noted in superlatives. If it is a plain statement of facts, its publication will benefit nobody; while on the other hand, if it is a string of exaggerations it might work a great deal of mischief. The mines of Sweetwater may turn out to be all that the writer claims them to be; but that remains to be seen. In the meantime careful men will wait patiently. We will close by giving a few extracts from the letter. The Pacific ledge is from 12 to 18 ft. wide, and shows some four or five miles; prospects very rich. "The Amphitryon shows for 4,000 ft. five ft. wide, and is probably the richest gold mine in the world. The Atlantic is A No. 1; crops out for four miles; is from six to fifteen ft. wide; assays \$197 per ton. The Mammoth is just as good. The Lone Star State shows gold in the rock; shows well, prospects very rich, and stands very high. Besides these a hundred others have been located, many of which are just as rich. The mineral belt in which these are found is 300 miles in length, by from 30 to 60 in width; but of this only a narrow belt of some 15 miles in length by five in width has been prospected, and the mines have been all found in this small space." "Three rich gulches have been struck within the last week. One of them, the Atlantic Gulch, prospects from three to 25 ets. to the pan; five ft. of gravel; plenty of water. Temple's Gulch gave \$1.45 from seven shovelfuls washed upon the shovel. This section of country is second to none on the Pacific coast. Such chances for investing money I never saw; such chances for business only occur now and then; such opportunities for introducing machinery and building mills probably never will present themselves for acceptance again." "Many capitalists are now on their way hither to invest, and ere spring opens upon us large sales will be made, if we can judge from present prospects. By October next not less than 30,000 men will people this very region where last July 18 Indians reigned supreme."

IDAHO.

Owyhee *Avananche*, Jan. 11th: The Oro Fino mine still continues to yield large quantities of gold bearing rock—in much of which gold is plainly discernible to the naked eye. The tunnel is 670 ft. in length; the discovery shaft tapping the tunnel is 180 ft. deep; there are three shafts in the tunnel of the following depths: South shaft, 75 ft.; middle shaft, 75 ft., and north shaft, 135 ft. in depth. The mine is now in such a shape that almost unlimited quantities of ore can be taken out.

In the Ida Elmore, the hoisting is done by steam, from a well timbered double shaft, 105 ft. deep, from the bottom of which a drift has been run on the ledge 200 ft. north and 60 ft. south. The ledge is from 2½ to five ft. wide between the casings. Thirty men are employed night and day in and about the mine. It is thought that the New York and Ida Elmore are one and the same ledge, and a drift is being run south on the New York to connect with the north drift on the Ida Elmore. We are informed that the distance yet to be run, in order to make this connection, is only a little over 100 ft.

In the Golden Chariot the ore is as rich as ever, much of it being of the same character as that of the Ida Elmore. From the point at which the tunnel taps the ledge a drift runs north 125 feet and south 50 feet. Three stopes are being worked in the north and two in the south drift. The mine is

now in fine shape for working—ere can be taken out faster than teams can be procured to haul it away. We understand that the Owyhee Co's mill has been engaged to work 300 tons. The Minar mill is also constantly running on Golden Chariot ore.

MONTANA.

Post, Jan. 4th: Letter from Phillipsburg, Dec. 20th: Mr. James Richardson arrived in town last evening from a three month's prospecting tour, and reports several small gulches, heading in the same range of mountains, that prospect well. In one, he states, as high as 75 cents to the pan was obtained in the gravel. Mr. Richardson discovered a succession of bar diggings that he thinks will average 30 ft. of gravel, and pay to hydraulic, \$40 to the hand, with an abundance of water handy. * * * A considerable speculation in claims is going on in the Georgetown district; several entire leads have changed hands of late.

Letter from Butte City: The Grey Eagle vein is four feet wide, and specimens which were assayed in Denver City gave over \$700 per ton in silver. One hundred yards north of this is the Original lode. This shows better defined walls than any other in Montana. On the discovery is a shaft 60 ft. deep. Nearly east from the Original is the Parrott lode. This is a strong and well defined vein. A shaft on the discovery, 30 ft. deep, shows the vein three ft. wide. Messrs. Ramsdale and Parks are now erecting a building 20 ft. wide by 50 long, to cover hoisting works. The ore of this lode, with a furnace properly constructed, will be easily worked. Both it and the Original have repeatedly yielded assays of over \$200 per ton in silver. One quarter of a mile northwest from the discovery on the Original, is the Mound lode, located by J. McPhoe. This vein appears to be six or seven feet wide. In the center is a streak of galena, specimens of which were assayed in San Francisco, and gave \$293 per ton in silver, with traces of gold.

In the way of preparations for placer mining next spring, Messrs. Allison and Humphrey are extending their upper ditch across Missoula Gulch, one mile further than it was completed last season. In doing this they run a tunnel 250 ft., cutting through an immense quartz lead named the Black Chief, 25 ft. below the surface. Three or four companies are preparing bedrock flumes. Three miles northwest from here, Geo. Rapp & Co. are digging a ditch from Brown's Gulch to Oro Fino, a tributary of Brown's Gulch. It is intended to carry 900 in. of water. They have good fall for hydraulics, and will use all of the water themselves.

The I. X. L. Co. cleaned up 220 ozs. of retort on Monday last, being the result of a five days run of their 24-stamp mill. We are informed by Mr. Ricker that the company recently purchased the mill in Grizzly Gulch, owned by Mr. Hendrix. The mill has 24 stamps, with the necessary appliances, and in the future will be kept steadily running on rock from the Union No. 2 ledge.

On the Park lode, the developments now being made by Mr. J. W. Whitlatch, are progressing favorably. There is now on the surface about 300 tons of first class ore ready for the mill. The shaft is now 130 ft. deep, with a crevice 3½ ft. wide, and the indications are that it will continue to widen as the lead is sunk upon.

On Monday night last, the driving shaft of the Philadelphia mill broke, which will cause a stoppage of the works for a week or so.

Messrs. W. D. and J. M. Mitchell have nearly completed their arastras on Granite Gulch, and will be prepared to commence operations next week. They are situated about half a mile above Junction, and are intended to do custom work exclusively. Water is to be used as the motive power, and the arrangements of the wheels and sluices, some six feet under ground, and arastras enclosed in substantial buildings, will enable them to be run the entire winter.

EMERALDA.

NEVADA.

Aurora Union, Jan. 11th: Mr. Redstone, late from Hot Springs, has with him over 80 lbs. of bullion, which would average over \$1 per oz., taken from the furnace of the Dozier Metallurgical Co.

HUMBOLDT.

Unionville Register, Jan. 11th: Several tons of Cumberland ore has been reduced in Holt's mill. The result has not yet been made public, work being immediately resumed on the mine and on the first south extension.

PAHRANAGAT.

Reese River Reveille, Jan. 13th: From Benjamin Evans, who arrived here a day or two ago from Pahranaagat, we learn that the mill which he is engaged in building

for a New York Co. is temporarily delayed for castings. Mr. Evans represents the developments in several locations on the extensive List ledge, especially in those of the Alameda and Webster Co., to be of the very best character. He considers the List to be one of the leading ledges of the southeastern part of the State, and that it will develop several mines. Mining operations are held in abeyance for the present, but the successful reduction of the ores of the district by the new mill will revive hope and restore confidence throughout the district.

REESE RIVER.

Reese River Reveille, Jan. 9th: In the Chihnaluna mine of the Centenary Co., in Newark district, there has been extracted up to the present time fully 1,000 tons of ore, and the supply is not exhausted, but there is a considerable quantity of ore within reach of the stopers. In the lode which extends from the shaft the vein is 11 ft. thick, and carries generally a good quality of milling ore. Extraordinary specimens of rich ore have been produced by the mine, the choicest of which yielded by assay at the rate of \$8,000 per ton.

Jan. 11th: By the stage which arrived last evening, 2,000 ozs. of bullion were brought from the mill of the Social and Steptoe Co. at Egan Cañon.

Some 3,000 ozs. of crude bullion were brought into this city this morning from Rigby's mill at San Antonio.

The ore recently shipped from the Silver Champion mine to Austin yielded at the rate of \$302 per ton.

Jan. 14th: Very beautiful specimens of rich sulphuret ore are produced by the North Star mine of the Manhattan Co. We saw to-day a brace of specimens, designed for a private cabinet, that for unique beauty and high quality of mineral surpassed almost any former production of that mine.

Jan. 15th: Persons recently in from Ophir Cañon state that the mill of the Twin River Co., which was stopped for repairs on the 1st inst., will be set in motion in a day or two. The Murphy mine of the Co. is producing an abundance of excellent ore.

There were brought into the city last evening by the Austin and Belmont Co's stage two bars of bullion from the mill of the Belmont Co.

Silver Bend Reporter, Jan. 11th: From Hot Creek we learn the following: Upon the location known as the Norfolk, adjoining the Merrimac on the south, about 150 yds. from the bed of Hot Creek Cañon, an incline has been commenced and a body of rich ore found. It occurs in a sort of conglomerate, and was at first thrown away as worthless; but an experienced eye having detected chlorides, and now and then a blotch of the black mineral peculiar to the Indian Jim in the dirty-looking mass, assays of it were had, and it was found to contain from \$400 to \$700 of silver per ton. It is owned by the Old Dominion Co. Work upon the Merrimac still continues without interruption. A tunnel is now in progress from the shaft to the eastern wall of the ledge, in which occasional bodies of fine ore are encountered. On the old Dominion mine, work continues upon both an incline and a tunnel. The latter will tap the vein at a depth of 200 ft. from the surface. Schiller & Co. are running the little 11-stamp mill erected by Gould, working about five tons of ore daily, with excellent results. The Old Dominion Co's mill is still running to its full capacity. Gillette & Clark have struck a large and favorable looking ledge on the foothills near the mouth of Rattlesnake Cañon, upon the north side. It is about 8 ft. wide, and shows a large amount of milling ore, but not of a very high grade. A conditional sale has already been made of this claim to parties who are now sinking upon it. It is expected that upon the opening of spring unusual activity will prevail in Hot Creek district, as much capital has already been invested there, and the developments made have resulted favorably. At Morey district, Hall & Co. are still taking from their mines ore of a splendid quality.

Reports from Silver Peak are as follows: The mill of the Great Basin Co. is progressing as rapidly as circumstances will permit. The capacity of the mill will be 40 stamps. The company has about 2,500 tons of ore ready for milling.

We saw at the assay office of Cahill & Bro. yesterday two bars of bullion from the Old Dominion Co's mill, Hot Creek. The bullion was exceedingly fine. There was also a small bar belonging to Judge Farris, from the little 10-stamp mill. It weighed 213 ozs., was .985 fine, and weighed \$271.25. We understand that all of the crude bullion from the Hot Creek mills will hereafter be melted and refined here.

WASHOE.

[In the Stock Circular, in another por-

tion of this paper, will be found late mining news from this district.]

Virginia Enterprise, Jan. 16th: The Empire-Imperial Co. have been delayed in the prosecution of work on their new shaft by the breaking of a large spur-wheel. It will be immediately repaired and work will be resumed.

Jan. 17th: Night before last a drift running westerly from the Halo & Norcross main shaft, on the 930-foot level, tapped a large vein of water. This is supposed to come from the main lead. In cutting the vein of water they also found some very fine ore, but little is known, as yet, of the extent of the deposit.

The Gould & Curry Co. are taking out about 60 tons of ore per day from their upper levels. Owing to their having exhausted their supply of fuel, the mill is now lying idle, and no work is being done on the engine shaft at the mine. Meantime the ore taken out is being stored at the mouth of their lower tunnel, ready for crumpling as soon as the roads improve sufficiently to allow of their obtaining a supply of fuel with which to run their mill.

A fine deposit of ore has been struck in the lower level of the Crown Point mine.

Jan. 18th: Owing to the scarcity of wood, a number of our mills and some of our hoisting works have been compelled to shut down.

Wells, Fargo & Co. shipped from their office in this city during the past week, 1,761 lbs. of assayed bullion, valued at \$32,594.05.

The Gold Hill News, speaking of the body of water lately struck at the 930-foot level of the Halo & Norcross mine, says: This new strike is probably in the main Comstock ledge, west of the smaller pay streak they cut through the other day, and in the vicinity of the winzes sunk for the lower level of the old workings. From all we can learn, the recent rise in the Halo & Norcross stock is based upon pretty good prospects.

NEW MEXICO.

Georgetown (Colorado) Miner, Jan. 2d: The following letter, from a former resident of this place, in relation to the Cimarron mines, Elizabeth district, New Mexico, Dec. 7th, 1867, is interesting. * * * This country has not been prospected except a small portion in the vicinity of Willow Gulch, and the indications for miles around are good. Rich mines have been struck every week since we came. They are dry now—the one thing needful is water, and it will be here in an abundance by the 1st of April. Davis & Co. are surveying a large ditch, some 22 miles in length, which will give water to a large majority of the claims. Mr. Pollock, of Denver, struck a rich pay streak at the mouth of Humburg Gulch on Thursday; and to-day we hear a good report from Mill's Gulch, about two miles north of this. We are doing some heavy prospecting between the two, and expect to record our own success in a few days. Charley Kennedy, in company with some other miners, from Georgetown and Central, were prospecting last week about 20 miles west of this on the Rio Hounda, a tributary of the Rio Grande. They found some old Spanish diggings, said to have been worked several hundred years ago. They opened an old shaft and found the skeleton of a man, standing upright. He had some mining tools, and in his pan they found a tolerable prospect. La Blanco, the veteran mountaineer and trader, acted as their guide. He is familiar with the legends and traditions of the Pueblo Indians, and knows, if any man does, the location of these ancient mines. Before Kennedy & Co. opened this old shaft, he stated, that according to Indian tradition a large number of Spaniards had been buried alive by them while working in the mines, and this seems to corroborate their story. Judge Blackwood, Kit Carson, La Blande & Co., bought a large tract of land embracing these mines some years ago, and have, I believe, as good a title as the country affords. They, however, place no obstacle in the way of the miner.

OREGON.

Jacksonville Sentinel, Jan. 11th: This week we had occasion to take a trip up Jackson Creek, where we found everybody and everything snowed in. At the Occidental quartz mill the snow was about one foot deep, and up the creek about half a mile further, the snow is said to be two ft. deep. Col. Drew has got the Occidental quartz mill about ready for running again. He has put about \$1,200 worth of improvements on the mill. Some entirely new pieces of machinery have been added, and it is the belief of the owners of the mill that they can save all the gold. A contract for crumpling 100 tons of quartz has been closed and the mill will proceed to work as soon as the quartz is delivered.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Sleet.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Felton.

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and paragraphs. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text-books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boies.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them; he has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study his rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times.

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office, Jan. 11, 1866.

Mr. C. T. Itaney is our duly authorized agent for Sacramento County, Nov. 29, 1867.

Dr. L. G. Yates is our duly authorized traveling agent, July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper, July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana, Aug. 17.

OUR NEW YORK AGENCY.—Mr. M. A. LATHROP, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No. 725 Broadway, for the present. Nov. 26, 1867.

San Francisco:

Saturday Morning, Jan. 25, 1868.

Notices to Correspondents.

FLORIST—Nothing is more common in floriculture than to observe the defective properties which varied colored flowers bear towards each other. Occasionally the eye sees nothing but breadths of blue or white; at another place it is dazzled by yellow, scattered in profusion—Indian pinks near the China rose and aster, and dahlias of varied red tints grouped together. For ornament, the principal rule to be observed in the arrangement of flowers, is to place the blue next to the orange and violet ones, in contiguity with those of a yellow color, whilst red and pink flowers never display to so much advantage as when surrounded with bright verdure intermixed with white flowers. The latter may be interspersed with advantage among groups of blue and orange and violet and yellow-colored flowers. In order to produce the most effective contrast, the associated flowers should approximate as nearly as practicable to the same size, and in many cases the color of the sand or gravel forming the surface of the adjoining walks should form an item for consideration.

AQUARIUS, Nevada.—Chemically pure water is not colorless, as is generally supposed, but is of a pure but feeble bluish tint, which only becomes visible to the eye when light has penetrated through a considerable thickness of that fluid. This fact is demonstrable by the following simple experiment: Obtain a glass tube six feet long and two inches wide, which must be blackened internally (with lamp-black and wax) to within an inch of the end, the latter being closed by cork. Throw a few pieces of white porcelain into the tube, which, after being filled with chemically pure water, must be set vertically on a white plate. On looking through this column of water (six feet deep) at the pieces of porcelain, which can only be illumined from below, by white light, it will be perceived that the pieces of porcelain appear of a light blue tint, the intensity of which will be found to diminish in proportion as the column of water is decreased, or the reverse.

LEARNER.—According to Laurent, carbon is deemed the only elementary body which is without an analogue. In all treatises on chemistry, it will generally be found compared sometimes with hydrogen, sometimes with boron and silicon; but these comparisons can only justly be made in one particular series of compounds, viz: the affinities of these substances for oxygen. In other respects, the analogy is incomplete. No instance has so far been adduced in which a chemical compound containing carbon can have that element replaced by some other simple body, which latter, despite of such permutation, still retained its principal properties. Carbon substitutions, therefore, are considered to be non-existent.

THE CHINESE NEW YEAR.—Yesterday was the Chinese New Year's—that anniversary occurring in January this year, instead of February, as usual, on account of the necessity of occasionally dropping a few days to make their bunglingly arranged calendar come out square with the seasons.

The Proposed Mining College.

Mr. Stewart's bill for the establishment of a National Mining School, is receiving pretty rough handling by the California Legislature. We presume that neither the author of the bill, nor any other man who has read it, would pronounce it just what such a bill should be; but we can see no reason why the subject should not be approached candidly and dispassionately. There appears to be a very great degree of unanimity on the subject of government aid, in some form or other, for the support of one or more mining schools. The experience of every mining country in Europe is unanimous in behalf of the utility, and in fact of the indispensableness of such institutions. At present we are entirely dependent upon European schools for all who are in any degree competent to superintend extensive and intricate mining and metallurgical operations. Nearly one-half of the students now pursuing their studies at the well known mining school at Freiberg, are from the United States; a fact which speaks most unmistakably of the importance of the establishment of such a school in our own country, and affords the most indubitable evidence that our people fully appreciate the advantages of that class of practical education.

The difficulty with our legislators appears to be the location and mode of selecting the management of such a school. Discussion upon these points is eminently proper, and great care should be exercised in the adoption of either; but hard words and uncalled-for personal reflections, will not lead either to unanimity or calm judgment in that direction. We need the school, and it is to be hoped that all partisan feeling and local prejudices will be held in abeyance, while the matter is calmly and quietly considered. At the proper time we shall have something to say upon the matter; and we shall endeavor to give a reason for our opinions. We have already, in advance of the late legislative discussion, recorded our protest against the manner in which Mr. Stewart's bill provides for the selection of the Directors, and we presume that before its final passage it will be modified in that respect.

With regard to the Commission which the bill would send to Europe, we presume the Department, or the officer to whom such selection will be delegated, will act with due circumspection, and select a delegation for its personal fitness. Of course none but such as are properly qualified by education and experience should be appointed to such a Commission, and we presume none but such will be done in regard to the selection of a location for the school until the report of that Commission is before the people. Such a report should combine facts and suggestions which ought to have an important bearing on the matter.

It is well and proper that our Legislature should take action in the matter; but that action should be such as to command the respect of those upon whom it is designed such will be so appointed. Nothing will to have an effect, rather than to generate unkind feelings. The matter should be dispassionately considered and discussed, and the entire question, as viewed by a State more largely interested than any other in the establishment of such a school, should be plainly and concisely laid before the National Congress. We trust wise counsel will prevail at Sacramento, to the end that the greatest good may be effected.

CORRECTION.—It appears that we were in error in locating "a cheap oil mill" lately built by "Dr. McDaniel," in the neighborhood of Santa Clara. The mill is just below Yuba City on Feather river. The error occurred in mistaking a clipping from the Santa Clara Argus for a local item, instead of a portion of a correspondence from Yuba county.

The Dozier Process.

Most of our readers have doubtless heard more or less of the "Dozier Process," which purports to be a new method for separating metals from their ores, which, it is claimed, is at once easy, rapid, and more complete than any process heretofore employed. This process is the discovery of Dr. A. T. Dozier, of Dutch Flat, in this State. A company has been recently formed to try it upon a large scale, and furnaces, etc., were erected for that purpose at or near Benton, Mono county.

The process is said to consist in mixing with the ores certain chemical agents, bringing and holding the mass at a low red heat, until the affinities forming the metalliferous compound are destroyed. The mass becomes a stiff paste, and on cooling resembles scoria. The metals of silver, copper and lead in the ore, take on a globular form, and remain to a great degree separate in the mass, not forming an alloy. The copper appears in an oxidized, granulated form. The paste on cooling becomes exceedingly brittle, and is easily reduced to powder; the silica and non-metalliferous portion being washed away leaves the silver, gold, copper, etc., in separate masses to be collected. Experiments which were made on Camanche ore, from Mono, and on Ophir and Reese River ores, are said to have resulted quite satisfactorily. The ore from the Camanche has hitherto baffled all attempts to reduce it; yet, with this process two experiments were made on it with most marked and satisfactory results. On pulverizing the brittle mass in a mortar, and washing away the earthy residuum, about 80 per cent. of the silver contained in the ore, in a nearly pure metallic form, was obtained, the remaining portion of the silver, with a trace of gold, remained unseparated with the copper, the copper being in an oxidized granulated form. The copper, with the gold and silver unseparated from it, can be run into bars, and its fineness determined. The silver obtained pure can also be run into bars. It is very difficult to determine from the above, whether there is anything new or valuable in the process. On general principles, we have but little faith in "new processes;" still, it is well that all reasonably promising projects should be tried before being utterly condemned.

THE PROCESS IN OPERATION.

We learn, by a letter dated at Benton, Mono County, January 1, 1868, that the Dozier Metallurgic Company put their works in operation, a few days since, and have produced several silver bars; also several samples of the oxides of copper, antimony and lead, in the form in which they are extracted from the mill by the Dozier process of refining. Samples of the work were to have been forwarded to their office at Dutch Flat. We should be pleased to hear more definitely and circumstantially from the Dozier process.

Our correspondent further informs us that the reducing and refining furnaces were designed by the joint labors of Dr. Dozier and W. A. Dond. The Company have taken steps to procure a patent for this discovery.

AS AN ADVERTISING MEDIUM for foundrymen and manufacturers of mining machinery, the *Mountain Messenger* of Downieville holds a commanding position, being located in one of the richest and most extensive mining sections of the State. Besides being the only paper in Sierra, with a large home circulation, it has many subscribers on the south side of Plumas and the north of Yuba. The *Messenger* is an 32-column paper, has lately appeared in a new dress, and we are pleased to note its continued prosperity.

BENEFIT BALL.—The Carpenters' Eight-Hour League, No. 1, will give a ball at Union Hall, on Tuesday evening next, in aid of the relief fund of that association.

THE PETROLEUM BURNER at 417 Mission street is still at work, and daily attracts crowds of curious and interested visitors. They are now using but two of the upper burners, and a single one underneath, for heating up the retort. The new retort, of which we spoke last week, is now completed, and will be ready for operation on Monday. This retort is twenty and a half inches long, sixteen wide, and eight high. It should be placed so that the top will come within nine inches of the fire-plate of the boiler, and the bottom raised about fourteen inches above the hearth of the ash-pit. This description will show the space which it will occupy in the furnace. In setting it in a furnace already constructed, it may be placed as high as is necessary in order to place the burners at a proper distance from the fire surface of the boiler.

The retort now in use is making steam for a single return-flue boiler of the following dimensions: boiler, twelve feet long with thirty-inch shell; twenty-six three-inch flues; iron front furnace, with brick sides and backs. Steam is kept at an average of one hundred pounds pressure.

The new retort will be able to make steam for a twenty-horse power engine by the use of a three-eighths-inch oil feed pipe, a three-eighths-inch steam jet, and a one-inch jet of air, under from one-half to two and a half pounds pressure, regulated according to the character of oil used. Oil from 20° to 30° density can be employed.

The cost of the apparatus for burning the petroleum, predicated on the use of an air-pump now being constructed by Mr. H. R. Martin, of this city, will be as follows:

Air pump.....	weight 150 lbs.	Cost \$45 00
Retort.....	145 "	25 00
Pipe, valves, etc.....	60 "	75 60
Total weight.....	355 lbs.	Cost \$145 60

This cost will not include the right to use the burners, the terms of which are not yet fixed. We shall continue to note the progress of this experiment as fast as anything new is developed. In our remarks last week with regard to the cost of anthracite coal in this market, we should have named the sum of about \$22, instead of \$16.

THE YOSEMITE GRANT.—Many words and much feeling is being expressed, both in and out of the Legislature, with regard to the grant of land to certain settlers in the Yosemite Valley. If rightly approached, the matter would have been a very plain and a very simple one; but unfortunately certain parties have succeeded in so mixing it up with politics and personal controversy, that it has become a very unpleasant and perplexing question. The State has accepted the territory as a trust for the people, with the express condition that no part of the same should be alienated. Certain rights in equity have grown up thereon, which Congress or the State should adjust. If the State undertakes to settle this matter, what right can she have to use the property granted as a means to that settlement? An honest man would have no difficulty in answering the question. Surely she must either go outside of the property in question for the means, or decline the custody thereof. She cannot either legally or morally, give away that which is not her own. The duty of the State is plain; she must either allow the property to again revert to the United States, or settle the matter in equity in such a manner as not to compromise the honor of the State. She has the power to lease for term of years. If politicians and meddlesome men would keep quiet, the parties interested in the equity might easily be satisfied, and soon be realizing a larger income from their improvements, than they could possibly have done if the State and nation had not expended so much money in advertising to the world the attractive features of their interesting and fortunate locality. If the Messrs. Hutchings and Lamson are wise, they will repudiate the action of their misguided or mischievous friends, and cheerfully accept, as a favor, what the well-meaning members of the Legislature would undoubtedly cheerfully accord to them.

CHOATE'S IMPROVED PADDLE WHEEL.—We have examined a model of a new paddle wheel for steamboats, known as Choate's Improved Paddle Wheel, which was patented Oct. 10th, 1865. In this wheel the floats are placed diagonally across the face of the same, being secured to a central and two outside sets of arms. Two sets of paddles are thus arranged in such a manner as to cross each other at or nearly at right angles, at the center set of arms. The paddles are set and curved similar to the Jones and McComb wheel, which was recently tried on the steamer John S. Whipple; only the latter consists of single paddles, placed parallel, instead of being angular or crossed and set at opposite diagonals. This wheel is the invention of Orin W. Clarke, of Newburyport, Mass., whose brother-in-law, J. W. Emerton, of this city, has been appointed agent for the same for this coast, and for China and Japan. In the construction of this wheel the rule adopted is that the distance across the face should be one-third the diameter of the wheel; and that each float or paddle should correspond, in its curve, to one-eighth of the entire curve or revolution of a screw, and in its location diagonally across the face of the wheel, should reach through one-eighth of the circumference of the wheel. This construction is designed to avoid the lift and plunge occasioned by the entrance and emergence of the floats of the ordinary wheel into and from the water. A great saving of power is also supposed to be effected, as well as avoidance of the jars and concussion which form such an unpleasant feature in the operation of ordinary steamboat wheels. We understand that our steamboat men who have seen the model, are very much pleased with the principle, and measures are in process to secure a practical trial of the invention at an early day. The model may be seen for a few days at this office.

NEW LOCOMOTIVE.—Another new locomotive has been turned out at the Union Foundry the past week. It has been built for the Black Diamond Co's railroad, at Mt. Diablo. This engine has been christened D. O. Mills; it is a G-wheel, direct action, tank engine.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 2v15-3m

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL (7 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (4 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOOD MILL (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators).....	Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....	Calaveras County.
MIDAS MILL CO. (4 Concentrators).....	Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....	Virginia City, Nevada.
VULTURE CO. (8 Concentrators).....	Prescott, Arizona.
NOYES & CO'S MILL (2 Concentrators).....	Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....	Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Sonora, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.
J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly,

LOUIS JANIN, Jr.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hay, Rags, screw and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Yeatch's tubs, Prater's concentrators, Wallace's pans, Beers' pan, German Barrels, Astra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Strauch Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

ELECTROTYPES CUTS, ENGRAVINGS, ETC.—Our Job Printing
Office is abundantly supplied with elegant engravings, or
name-plates, and other embellishments to suit the various
branches of industry in this State.

CAPITAL AND LABOR.—The effect of the
present dullness of business in our Eastern
cities, shows how closely the interest of
capital and labor are bound together, and
how foolish is the doctrine of an "irrepre-
sible conflict" between them. The weight
of the present depression falls directly upon
capital; but how quickly it communicates
to labor. The injury sustained by the first
is felt as sensibly by the second as if they
were limbs of the same body. The same
sympathy would be apparent if the blow
fell first upon labor. Capital would, in that
case, feel the shock, and would suffer
equally in the consequence. The present
experience is not needed to demonstrate
the close affinity between capital and labor;
but since the doctrine has been earnestly
advocated of late years, that they are her
natural and hereditary enemies, it is well to
note the contrary evidence which is now
patent to a large number of unemployed
workmen and others. Their number in
New York alone is not less than 50,000.

When a blow is struck upon the head of
a wedge, the effect is as the sum of the sides
to the head of the wedge.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by
which a number of European and Asiatic countries, hith-
erto beyond the reach of our mail communication except
by letter, are brought within the range of delivery of all,
or nearly all, United States mail matter. It is a singular
fact, unknown probably to most persons who have not
occasion to learn it by unpleasant experience, that there
was a considerable region in the civilized world where
an American traveler might not receive a newspaper di-
rectly from home.

Under the arrangement now completed, prepayment of
postage (sometimes at high rates), is made necessary in
all cases. The following official statement gives a full list
of the countries—with some of which there has been regu-
lar communication—that are now included in the delivery
by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter
(periodicals, etc.) sent from the United States to coun-
tries in Europe and Asia, by Bremen or Hamburg
mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.
Hamburg, by Hamburg mail—2 cents each.
Prussia, Austria and German States, by Bremen and
Hamburg mail—3 cents each.
Lunenburg, by Bremen mail—3 cents each.
Lunenburg, by Hamburg mail—3 cents each and 1 cent
per 1½ ounce.
Schleswig Holstein and Denmark, by Bremen or Ham-
burg mail—3 cents each and 1 cent per 1½ ounce.
Sweden, by Bremen or Hamburg—3 cents each, and 1½
cent per 1½ ounce.
Norway, by Bremen or Hamburg—3 cents each, and
3½ cents per 1½ ounce.
Holland, by Bremen or Hamburg—3 cents each, and 1
cent per 1½ ounce.
Russia, by Bremen or Hamburg—3 cents each, and 1
cent per 1½ ounce.
Switzerland, by Bremen or Hamburg—4 cents each.
Italy, by Bremen or Hamburg—5 cents each.
Turkey, by Bremen or Hamburg—3 cents each, and 5½
cents per 1½ ounce.
Greece, by Bremen or Hamburg—3 cents each, and 5½
cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg
—3 cents each, and 1½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg
mail via Marseilles—3 cents each, and 9 cents per 1½
ounce.
Austria, India and China, by Bremen and Hamburg
mail, via Trieste—8 cents each, and 2 cents per ½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.
Hamburg, by Hamburg mail—1 cent per ounce.
Prussia, Austria and German States, by Bremen or Ham-
burg—1½ cent per ounce.
Lunenburg, by Bremen mail—1½ cent per ounce.
Lunenburg, by Hamburg mail—1½ cent per ounce, and
1½ cent per 1½ ounce.
Schleswig Holstein and Denmark, by Bremen or Ham-
burg—1½ cent per ounce and 1½ cent per 1½ ounce.
Sweden, by Bremen or Hamburg—1½ cent per ounce,
and 2 cents per 1½ ounce.
Norway, by Bremen or Hamburg—1½ cent per ounce,
and 2 cents per 1½ ounce.
Holland, by Bremen or Hamburg—1½ cent per ounce,
and 1½ cent per 1½ ounce.
Russia, by Bremen or Hamburg—1½ cent per ounce,
and 1 cent per ½ ounce.
Italy, by Bremen or Hamburg—1½ cent per ounce, and
2 cents per ½ ounce.
Turkey, by Bremen or Hamburg—1½ cent per ounce,
and 5½ cents per 1½ ounce.
Greece, by Bremen or Hamburg—1½ cent per ounce,
and 5½ cents per 1½ ounce.
Gibraltar, Spain and Portugal, by Bremen or Hamburg—
1½ cent per ounce, and 2½ cents per 1½ ounce.
Austria, India and China, by Bremen or Hamburg mail
by way of Marseilles—1½ cent per ounce, and 9 cents per
1½ ounce.
Austria, India and China, by Bremen or Hamburg mail,
by way of Trieste—6½ cents per ounce, and 2 cents per ½
ounce.
These charges are in each case in full to destination,
combining rates between the United States and Bremen or
Hamburg, and the rate beyond Bremen and Hamburg to
points of delivery.

NEW GRENADA MINES AGAIN.—The Virginia Enterprise of Jan. 18th, gives a portion of a letter recently received from Bernard Nauman, an old resident of that city, now in Barbacoas. We quote:

Mr. Nauman says that Louis O'Connor, well known in this city, and the man whose first big raise in the New Granada mines of some \$20,000 caused the big and disastrous rush to that region a year or two since, made a still bigger raise last summer, taking out in three months about 1,000 pounds of gold. He paid all expenses and received half of the gold taken out. The writer says it is known that he took away 420 pounds of gold, and it is thought that he might have had more. Mrs. O'Connor, who was also there, took away fifty pounds on her own hook. Mr. Nauman estimates the haul made by O'Connor on his second visit to the mines at \$110,000. He speaks of the arrival in the mines of three gentlemen from San Francisco, Messrs. Henry, Fowler and Pierce. They had been looking around and were about taking a bank high up on the river Nambi. Mr. Nauman is anxious to get out of the country, having prospected four or five banks without making a cent above expenses, and enduring all kinds of hardships and abuses at the same time. He advises all his friends to give the New Granada mine a wide berth if they don't wish to become prematurely old and be brought to the verge of suicide once a month.

RAILWAY RISKS.—The statistics of European railways bring out some very droll results—if such an epithet is admissible in treating a subject that pertains to human life. They show that the absolute risk of a person's losing his life in a rail car is less than his being struck by lightning, or being hanged; that a passenger shooting along by steam power, at the rate of seventy-two miles an hour, is more secure from bodily injury than the pedestrian in a crowded city, or a gentleman driving his private carriage on a country road; and that the oil-begrimed and sooty pair who ride on the engine, on whom we look with pity, as predestinated for destruction, have an average immunity from danger, and enjoy a better state of health than we, whose personal appearance may be more presentable, but whose pity is entirely gratuitous. A person debilitated by dyspepsia or pulmonary disease, would question the sanity of his physician if recommended to take the position of fireman on a locomotive; yet statistics show that the employment tends to counteract these diseases, and to strengthen all the vital functions of the system.

GOLD IN NORWAY.—Mr. Ashburn furnishes the Nevada Transcript with a translation from the Scandinavian of October 17th, in regard to the discovery of gold mines of almost fabulous richness in Norway: "These fields are found in the northern part of Norway. It is said that a tributary of the Tana river, which forms, in part, the boundary between Norway and Lapland, on account of the late spring and high water, changed its channel in one place, and in the old bed of the stream gold was found; not only in fine dust, but also in large lumps. One person who has been in California states that the locality where this discovery was made resembles very much the gold fields of that State. Gold is also said to have been found in Alten. The Christian Morgenblad has information from Finmarken that wages for workmen engaged in gold washing in the rivers have gone up several dollars specie per day."

SOMETHING NEW AND GOOD!

TRY IT! PRESERVED COFFEE,

PREPARED FROM

THE BEST OLD GOVERNMENT JAVA COFFEE,

Condensed in the form of a Paste, by a process patented September 3d, 1867. One ounce equal to two of the best Ground Coffee, and suitable for any gentleman's table. Preserves its strength and flavor without deterioration in any climate, and without regard to length of time.

If you want Chicory, apply it yourself.

Olive our Coffee a trial, and if it is not fifty per cent. cheaper and better than any other, we will return your money.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1.—Assaying of Ores, Metals, and other Mineral Substances.
- 2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.
- 3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.
- 4.—Concentration.—Dressing of Ores.
- 5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.
- 6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas. If desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

The Steamship CHINA, Capt. E. W. Smith, will be dispatched January 13th, at noon, ascending wharf, corner of First and Brannan streets, for YOKOHAMA and HONG-KONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co.'s office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

New Mining Advertisements.

Chilpancingo Mining Company.—District of Cres,

Senora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of January, 1888, an assessment of five dollars per share was levied upon the capital stock of said Company, payable immediately. In United States gold and silver coin, to the Secretary, 318 California street, San Francisco, California.

Any stock upon which said assessment was levied, and which was not paid on or before the twenty-sixth day of February, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of March, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISE, Secretary.

Office, 318 California street, up-stairs, San Francisco. jan25

Office, 315 California street, San Francisco. Jan 25

Welch Quicksilver, Silver and Copper Mining Company, Mount Diablo Mining District, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of January, 1888, an assessment of three dollars (\$3) per share was levied upon the capital stock of said Company, payable on the tenth day of March, 1888, to the Secretary, George Byles, at his office, Room No. 15 Stevenson House, southwest corner of Montgomery and California streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventh day of March, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of April, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE BYLES, Secretary.
Office, Room No. 15 Stevenson House, S. W. corner Montgomery and California streets, San Francisco. Jan 25

Mining Notices—Continued.**Arizona Consolidated Mining Company, Fortuna District, Arizona Territory.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of December, 1887, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable in United States gold and silver coin, to the Secretary, at the office of said Company, No. 511 Clay street.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of January, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of February, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. W. BUNNELL, Secretary.
Office, No. 511 Clay street, San Francisco. Jan 25

Cordillera Gold and Silver Mining Company, Chihuahua, Moresnes Mining District, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of January, 1888, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 321 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-seventh day of January, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of February, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco. Jan 25

Die Padre Gold and Silver Mining Company, Alamos, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of January, 1888, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, corner Broadway and Battery streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the eleventh day of February, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the fifth day of March, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. C. McCOMB, Secretary.
Office, corner Broadway and Battery streets. Jan 25

Hope Gravel Mining Company—Location of Works and Property: Orass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of December, 1887, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, No. 53 Kearny street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-second day of January, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of February, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.
Office, No. 53 Kearny street, corner of Sacramento, San Francisco, California. Jan 25

Hancock Copper Mining Company. Location: Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of January, 1888, an assessment of seventy-five cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 699 Market street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the fourteenth day of February, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the second day of March, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

S. S. SWEET, Secretary.
Office, 699 Market street, San Francisco. Jan 25

By Mail.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

La Hlanan Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the second day of January, 1888, an assessment of two dollars and fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 314 Front street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the first day of February, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of February, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. SIEVERS, Secretary.
Office, No. 314 Front street, San Francisco. Jan 25

Mount Tenabo Silver Mining Company—Location of Works: Cortez District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of January, 1888, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 428 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twelfth day of February, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twelfth day of March, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.
Office, 428 Montgomery street, San Francisco. Jan 25

U. S. Grant Mining Company—Location of Works: Cortez District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of January, 1888, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 428 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twelfth day of February, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twelfth day of March, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. W. BUNNELL,

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** 1st San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

Pacific Iron Works, 915 1st

San Francisco, Aug. 29, 1867.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

— BY —

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077 3rd St. SAN FRANCISCO.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND PLACER MINERS, is called to this new invention for saving fine gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address Dr. J. B. BEERS, San Francisco, Per Wells, Fargo & Co's Express.

LEFFEL'S

American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc.

CALIFORNIA REPRESENTS:—E. Stockton, Folsom; O. Simmons, Oakland; (Mill at Clear Lake); Morgan Coville, Lexington; Santa Clara County; J. Y. McMillan, Lexington; Santa Clara County. Send for Circular to

KNAPP & GRANT,

Agents for California.

26v13-lyq 310 Washington street, San Francisco

NOTICE TO MERCHANTS
— AND —
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz. Greater strength; less danger in working; as goods require no slinging or lashing, consequently make fewer breakages; requires one man less to operate; it stops with the load at any point, without any fasten ing or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO.,

By Joseph Moore, President.

HUNGERFORD'S

Improved Concentrators.

MR. HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miers' Foundry, in this city, or at Goss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to.

MORGAN HUNGERFORD.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages the advertisement is enabled to offer these machines to the public at the following low terms:

No. 1—10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, **\$600**
No. 2—15-inch Crusher, capable of similarly putting through five to six tons per hour—**\$850**
No. 3—20-inch Crusher, will in a similar manner crush from seven to eight tons per hour—**\$1,200**

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: "RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill."

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1866. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of emporing, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of May 22, 1866. JAMES BRODIE, Fulton Foundry, or CHARLES RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

12v13 tr

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages.

Every infringing machine is made and offered for in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

PATTINSON'S
HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

7v15-4y

THOMAS PATTINSON

THE CELEBRATED
Self Generating Portable
Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As all outside light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State.

18v14-3m

WILCOX'S
Patent Steam Water Lifter.

Received First Premiums at the California State Fairs of 1866-7.

Send for Circular.

A Steam Pump without Engine, Piston, Plunger or Back-suction, using both the expansive and elastic power of steam, and doing more work with the same amount of fuel, than any other Pump driven by steam power. It is applicable to either light or heavy work, whether for mining, irrigation or other purposes. It has been used of various capacities, from 50 to 30,000 gallons per hour, and can be made of any size required. It is not injured by sandy or muddy water. In light or lift it is limited only by the strength of the boiler used.

For further information, apply to M. & A. WILCOX, Proprietors, No. 19 Front Street, between 1 and J Sts., Sacramento, Cal. 25v15 2m3m

The Manufacture of Furniture.

The manufacture of furniture in this city is fast assuming an importance among the leading industries of the State. Commencing some ten or twelve years since with the labor of three or four men, the business has grown to such an extent that it now employs nearly four hundred men, who last year turned out new furniture to the value of nearly or quite \$1,000,000; while a large amount of additional labor and capital is employed in setting up and completing furniture that is partially manufactured at the East. The total aggregate paid for material and labor in the entire furniture business of the city during the past year cannot amount to less than \$1,800,000. Our native woods are also coming largely into use, particularly the California laurel.

The report of the Scientific Commission which visited Alaska the past summer, will doubtless lead to the introduction into the business of some of the more valuable woods from that quarter. Considering the high price of labor on this coast, and the absence of any great variety of native woods suitable for such manufacture, the rapid increase in this branch of industry may be considered very remarkable.

The immense importations which are annually made to meet the demands for furniture in this State, shows plainly that there is here a large field for the employment of labor and capital. We have already some six or seven furniture manufactories which will compare favorably, in magnitude, with many of the leading manufactories at the East. Among these, we would at this time notice particularly

MR. W. G. WEIR'S ESTABLISHMENT.

The factory of Mr. Weir is located on Hayes street, near Ninth. Forty hands are constantly employed—all skilled workmen, as most of the furniture turned out at this establishment is of a superior workmanship for its class, and quite superior to the same class of work imported from the Atlantic States. Mr. Weir commenced business as a pioneer some ten years since, in a limited way, and has gradually pushed his course upwards, until he now competes, successfully, with the best houses in his line of business. The factory has a frontage of fifty-six feet, and a depth of one hundred and twenty. The first floor is mainly occupied by various descriptions of machinery, that are kept in operation by steam. The front rooms are used for finishing and delivering the goods manufactured.

The machinery, located on the ground floor, is in perfect working order, and includes all the machinery and appliances requisite for a first-class establishment. Nearly all the work of the factory is done by machinery; the several parts of tables, bedsteads, bureaus, etc., are cut and formed in this manner. The principal materials used are redwood, Oregon pine, sugar pine, Spanish cedar and white cedar; for veneering purposes, walnut, mahogany, maple, and rosewood. The factory is at present turning out a style of painted chamber sets that are held in good demand, and compare favorably with imported goods in point of neatness and durability, and at very low prices. The total amount of wood cut every day and used for manufacturing purposes is fifteen hundred feet.

The second floor of the establishment is occupied by workmen engaged in veneering, painting and finishing. Some very superior specimens of workmanship in the way of extension, dining and center tables, the latter with finely-polished marble covers, are to be seen, some of which are, in part, beautifully carved, and would elicit admiration in the best workshops of Europe or America. The only articles of furniture not manufactured at Mr. Weir's establishment are chairs and sofas. His French style of bedsteads and looking-glass frames are durable and elegant. A large number of cases for printers' use have just been completed at this establishment. This, we believe, is a new branch of furniture business in this city.

The increase of the business of manufacturing furniture has made it necessary on the part of Mr. Weir to enlarge his establishment. He is now erecting a new wing, twenty by sixty feet, where he intends placing a large amount of new machinery, and giving necessary facilities for expanding

his operations. The amount of goods now produced at the factory is about \$80,000 annually, and it is estimated that the quantity during the ensuing year will reach double that sum.

Were it not for the internal revenue tax, which bears harder upon manufacturers in this State than at the East, this establishment would more than double its present capacity, and would give employment to over one hundred men.

LONG TELEGRAPHIC CIRCUIT.—If we are not mistaken, the following is the record of the longest overland telegraphic circuit ever made. The Chicago Tribune of Dec. 16th, says: An unbroken circuit was made, and messages sent without repeating, between Houston, Texas, and Salt Lake City, via New York. The Houston operator sent: "Houston sends greeting to Salt Lake. We sit with coats off and windows open." Salt Lake promptly replied: "Weather beautiful here, but have a snow storm in Montana. Brigham Young has just martyred another heifer." Houston replied: "Don't touch the brass in your key, or you'll get yellow fever." After this, Helena, Montana, 550 miles north of Salt Lake, was "put on" and conversed a few moments. The circuit worked over the following route: Houston, New Orleans, Mobile, Knoxville, Washington, New York, Chicago and Salt Lake. Had the San Francisco operator not been out of the office, he would have been drawn into the circuit, and the length extended 1,000 miles more. This is a rather remarkable performance, since Houston is 1,800 miles from New York, which is also 2,436 miles from Salt Lake City. The weather was very favorable and the wires in good condition.

SINGULAR OCCURRENCE.—The Barnstable Patriot relates a singular occurrence at the Highland Lighthouse on the evening of November 22d. Soon after nine o'clock the keeper was startled by a deafening crash, as of a loaded gun fired on a mass of glass. For a moment it seemed as if the tower itself must have hurst asunder. On further examination, it was discovered that a pane of glass, thirty-six inches by twenty-four, and a half an inch thick, had been shattered into a thousand pieces, though not broken entirely through, as by a heavy blow on the outside. On going to the ground, the mystery was explained by finding three large black ducks lying dead under the broken pane—one of them with its neck broken in several places, its breast split open the entire length, and the bones crushed to atoms. Such was the destructive force with which the bird has been propelled against the window, in its flight across the bay in the night.

SWORD BLADES.—The renowned manufactory of Toledo, which gave their celebrity to Spanish blades, is said to have been established as far back as the ninth century by the Moors, to whom, in fact, Spanish civilization, if such it may be called, owes its origin. In later times, the *Fabrica de las Armas* was suddenly closed, upon which the artists dispersed themselves and set up factories in different parts of Spain and Portugal, at Lishou, Orgaz, Seville, Zamagosa, Bilbao, and other places. In our old literature we meet with frequent allusions to Spanish swords, as in Romeo and Juliet, Othello, and the Merry Wives of Windsor. In the mountains of Arragon, near Calatayud, and in those of Guipuzcoa, near Mondragon, is found the best iron in Spain, perhaps in Europe. Over these mines flow several streams of icy coldness, a fact which suggested to the native miners the idea that the iron itself was frozen, and hence weapons made of this metal were said to be of the ice-brook's temper.

ALASKA.—It is claimed by parties more or less acquainted with the capacities and resources of the newly acquired Territory of Alaska, that the resources and capacity of that country are very considerable; that the fur trade, the fisheries, and the universal wealth of that region are of sufficient extent to supply remunerative employments to a very large population. It is also asserted that there are now in the Territory about 700 Americans, and nearly, or quite, 7,000 Russians and half-breeds, who will remain in the country.

PHYSIOLOGISTS assert that, if all immigration into Paris should cease, so that no fresh blood could come from the country, the population of the city would dwindle in numbers, deteriorate in force, and become so nearly *effete* in five generations as to be incapable of reproduction.

The labor crisis is reported to be fearful in some parts of England and France, and probably never before in the history of this country were there so many able-bodied men out of employment.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20, 10 cents.
Over \$20 and not exceeding \$50, 25 cents.
No fractions of cents to be introduced in an Order, United States Treasury Notes, or National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained. Post offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out: No. Amount Date, 186

MONEY ORDER.

Required for the sum of \$.... Payable at, State of, Payable to, Residing at, State of, Entered in Register:, Postmaster.

Names of parties and places, and the sums, to be written in the plainest possible manner. As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

List of Money-Order Post Offices in the Pacific States and Territories, May 20, 1867.

SULPHURETS;

What they are;
How Assayed;
How Concentrated;
And How Worked;

With a Chapter on the
BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.
For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns. 21v15f

Pacific Chemical Works.

**Aqua Ammonia,
Acetic Acid,
Acids Chemically Pure,
Nitrate of Silver,
Cyanide of Potassium,
AND CHEMICALS OF ALL KINDS.**
Manufactured by the PACIFIC CHEMICAL WORKS.

Laboratory, Sixteenth street, near Folsom. Office, 623
Montgomery street, San Francisco. 21v15f

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,
8v13-1y Slovo Store, No. 125 Clay street, below Davis.

To Quartz Miners.

Two Quartz Mills for Sale at very Low Rates.

PARTIES WISHING TO PURCHASE WILL SAVE 50 PER CENT. by calling at HOWLAND'S SAMPLE MILLS, No. 24 California street, San Francisco. 21v15-3m

HAYWARD & COLEMAN,

IMPORTERS AND REFINERS

—OF—

Illuminating, Lubricating,

—AND—

PAINT OILS!

CONSISTING OF

KEROSENE, LARD, SPERM, ELEPHANT, POLAR, TANNERS, SEATFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO,—

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning oil.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

PELLERY'S

Patent India Rubber Paint and Cement

Is composed of India-rubber and other gums, dissolved in pure linseed oil, mixed with the various coloring matters, and ground in any color. We paint Wood, Brick, Metal, Cloth, etc. It is a superior Marine Paint. Will not rot, peel, blister or crack in any climate. Fifteen hundred Fish ing Vessels at Gloucester, Mass. use it a superior to other paints. We refer to Steamers America, Senator, Paul Pry, Julia, etc., and W. K. Van Allen, S. E. Bugbee & Son, Tubbs & Co., C. W. Thomas, Silvery Johnson, Dr. Hinton, Gen. Connor, Stockton, H. L. Davis, Jas. Dick, J. P. Pierce, Esqs., and others. Filbert Street School House, two coats on redwood, equal to three coats lead. One hundred pounds paint equal in bulk to two hundred pounds lead. Cementing and painting new or old Tin or Metal Roofs. We first cement around fire walls and skylights all holes and cracks, then apply a good coat of paint. A good, clean, tight roof is certain. Price, from one to three cents per square foot, according to size and condition of roof.

New Cloth Roofs put on, saturated with liquid rubber, then painted at nine cents per square foot. We use none but the best materials and pure linseed oil. No lead turpentine; neither asphaltum or coal tar.

Also, for sale, "Submarine Rubber Varnish," \$5 per gallon; any color. We will apply to Vessels' Bottoms, or furnish at \$5 per gallon. 21v15f

JACKSON & SPAULDING.

NEW LOCOMOTIVES FOR THE C. P. R. R.
The Central Pacific Railroad Company have lately set up at their shops in Sacramento, six new locomotives, of the most approved construction. These engines are named as follows: Idaho, Sampson, Goliath, Ajax, Achilles and Antelope. The Idaho is designed for freight service, and is regarded as a particularly fine specimen of workmanship. It weighs, with its tender, 57 tons, has 4-foot drivers, and is provided with Hooker's patent pump. Wm. H. Mills takes charge as engineer. The company have ten other locomotives in their shops at Sacramento, all ready to be set up. These engines are built at the East, then taken to pieces and forwarded to this coast, to be set up again for use. It is to be hoped that circumstances will soon enable the company to manufacture both their locomotives and cars in their own shops, or to give them out to bidders on this coast.

SCHOOL REPORT.—We have received a copy of the annual report of Mr. John C. Pelton, Superintendent of Public Schools of this city, for the school year ending October 15th, 1887. The report comprises a volume of 240 pages, a portion of which, however, has already appeared in the recently published volume of municipal reports as the Superintendent's report to the Board of Supervisors. The balance of the report before us is addressed to the Board of Education, and contains many valuable suggestions to teachers, school directors, parents and others—among which we notice the appointment of teachers, vacations and holidays, text-books, school discipline, school attendance, modes of studying the various branches, overworking of pupils, etc. Quite a number of pages are devoted to a detail of the questions put to the pupils of the higher schools in examination for graduation, May, 1886; also the questions put to applicants for the position of teacher. We shall endeavor to allude to some of the prominent features in the report at a future day.

A TERRIBLE ACCIDENT occurred at the Brown Brothers' mill at You Bet, a few days since. Mr. Geo. Brown, one of the proprietors, and superintendent, while oiling some part of the machinery near the shaft of the water wheel (a hurdy gurdy), accidentally slipped and fell against the shaft in such a manner that his clothes were caught by it, and his body whirled around at the rate of about 150 revolutions a minute. It was two or three minutes before the accident was noticed, and of course, the unfortunate man was quite dead—his feet and legs were beaten off up to his knees, and nearly every bone in his body broken.

The Pioneers have purchased the vacant lot on Sutter street, in the rear of the Masonic Temple, on which they propose to erect a building which shall hereafter be their permanent home. The location is a most excellent one.

EXTENSIVE ALMOND CULTURE.—C. W. Reed, of Yolo County, intends to cover one hundred acres of land in that county, the coming summer, with soft-shell almond trees.

CONTINENTAL Life Insurance Company,
302 Montgomery street, corner of Pine.

HANSBROW'S CHALLENGE Deep-Well, Mining and Double-Cylinder Patent Pumps.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,
LOCKE & MONTAGUE,
112 and 114 Battery Street, San Francisco.

SIXTH INDUSTRIAL EXHIBITION

UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE,

SAN FRANCISCO.

The undersigned, acting under authority from the Mechanics' Institute of the City of San Francisco, take great pleasure in announcing to the public that they have resolved upon holding an Industrial Exhibition in the month of August, 1888, on a much larger scale than was ever before attempted on this coast; and they make this early announcement of their intention, that all who may desire to participate shall have ample time for preparation.

A programme, embracing rules and regulations for the government of participants, with a list of Premiums to be awarded, etc., is receiving such earnest and careful attention as the importance of the enterprise demands and in due season the same will be made public by circular letters widely distributed, and by advertisements in the leading journals of this coast.

Moore's Patent Friction Hoist.

We give herewith an illustration of a late California invention, which is now being quite generally introduced into the warehouses of this city, where much hoisting is required. It is the invention of Mr. Joseph Moore, President of the Vulcan Iron Works Company, of this city. The device is extremely simple, and possesses many advantages.

rope or chain which coils around the axle, *D*; *E*, is the wheel around which the rope passes, by which the load is elevated, and it is connected with the axle, *D*, by suitable gearing. The drum, *F*, contains the mechanism for stopping the load at any point, and is so arranged that the outer case is held by compressing levers operated by the weighted arm, *H*, so that the wheel, *E*, can be turned in one direction to raise the load,

MOORE'S PATENT FRICTION HOIST.

ages over the common hoist, among which may be enumerated greater strength, less danger in working, and as goods require no slinging or landing, breakages and accidents are almost impossible. By the use of a platform, no more trouble or difficulty is encountered in transporting goods from one part to another on the same floor. This hoist requires but one man to operate it, as it may be readily and safely stopped at any desirable point to allow of the single operator to go from one story to another in the transfer of his goods. In stopping it, with its load, either ascending or descending, no fastening or any attention whatever is required from the operator.

In the engraving, *A*, represents the platform upon which the load is to be placed. This platform moves between upright guides and has attached to the bar, *B*, the hoisting

but is prevented from moving the opposite way. To lower the load, the arm, *H*, is raised by the cord, *I*, which extends to the lower floor, thus allowing the case, *F*, to slip between the levers.

BRIDGE ACROSS THE BAY.—Notice has been given of a bill to grant the right for the construction of a bridge across San Francisco Bay, from the most convenient point on the Alameda shore from which to reach Hunter's Point. The proposed bridge is to contain a double carriage way, and a railroad and foot way. It is generally thought to be a project of the Central Pacific Railroad Company, to provide for that road a direct access to San Francisco. There can be little doubt but that the overland railroad will eventually be brought into immediate communication with the P. M. S. Co's wharf.

THE COMING INSTITUTE FAIR.—A correspondent writes us, in relation to the approaching exhibition of the Mechanics' Institute, that in the exhibitions heretofore held, injustice has been done to labor, inasmuch as capital has often been rewarded by medals, etc., when the honor was justly due to the journeyman who performed the work—instanting in particular, the exhibitions of tailors, hatters, bootmakers and others, in which the party received the awards did nothing more than to furnish the capital involved in the manufacture.

We cannot see any ground for complaint on the part of our correspondent, for the reason that the classes of persons of whom he speaks, have as full a privilege as their employers, to exhibit the production of their own industry. Notice has already been given for all such persons to bring in the products of their industry to the coming exhibition, where they will have every attention and advantage for exhibiting, which is accorded to their employers. Employers, of course, cannot be ruled out, and the employed never have been. If our correspondent and his friends will begin now, in season, they will have ample opportunity to put themselves in their proper position before the public at the coming Fair; and we will venture to assure them that when two exhibitions of equal merit are competing for the same prize—the one exhibited by an employer, as the workmanship of another, and the other exhibited by the fabricator himself, the latter will always have the preference in the minds of all honest minded committees of award. Such, we are quite sure, would be the feelings of the management of the Institute.

ASTRONOMICAL.—It is seldom that a more beautiful astronomical display is witnessed than was exhibited on Tuesday evening last. The storm-clouds which have obscured the sky almost continually for the past two months, had passed away, and the air was remarkably clear. Thousands of people were in the streets gazing at the display formed by the peculiar conjunction of the Moon, Jupiter and Venus. The crescent of a new moon had just appeared, and below it, at equal distances, of about 5°, and in line, appeared successively Jupiter and Venus, shining in all the brightness due to the purity of a clear California atmosphere. It is not often that this peculiar conjunction occurs. It has also been interesting to watch the gradual changes of these heavenly bodies on subsequent nights—the Moon rapidly receding and increasing in apparent size, while Jupiter, with hasty movement, gained rapidly upon his more brilliant companion, until on Thursday he appeared in a line horizontally with Venus, both planets disappearing below the horizon at the same time.

REMOVAL.—By reference to their card, which will be found in another column, it will be seen that Messrs. Falkenau & Hanks, of the Pacific Chemical Works, have removed their city office to 619 Montgomery street.

CARVALHO'S STEAM SUPERHEATERS.—We noticed, a few days since at the Aetna Works (Hanscom & Co.) four of Carvalho's Steam Superheaters, which were illustrated and described in this paper a few weeks since. One pair of these superheaters was intended for the boiler making steam for a 75-horse power engine of a gold quartz mill, in the interior; the other pair was for the boiler of a 25-horse power hoisting engine, also in the interior. The Superintendent of an industrial establishment in this vicinity, who has recently placed this superheating attachment to his boilers, is loud spoken in their praise, and says he does with 40 to 45 lbs. of steam, and throttle valve partly open, what formerly required 65 to 70 lbs. of steam, and throttle valve wide open; that he is also using very much less water and fuel, and gets up steam in much less time. This is an invention that has been in use at the East for a long time. It is durable and safe, and must certainly prove of great benefit to the Pacific Coast.

AMERICAN MINERALS AT THE PARIS EXPOSITION.—A correspondent of the *Laboratory*, a scientific journal published in London, after giving a full description of the mineral display in the United States section says: "In fact we have remarkable specimens of every description of economical mineral known in the world, all shown with perfect intelligence, all neatly arranged, clearly labeled with their proper description, so that the visitor has simply to use his eyes in order to know what he is looking at. In most cases the composition of the mineral, or at any rate, its economic value, is attached to it. It is impossible to praise too highly the talent and energy of those gentlemen who have had the arrangement of this magnificent display of minerals. Foremost amongst them are Dr. Pigné, and Messrs. Angel, Blake and Whitney."

SUFFERING IN FRANCE.—The mails bring tidings of terrible sufferings in all parts of France, in consequence of the stagnation in the various kinds of manufacturing enterprises. Hunger and destitution are making sad havoc among the operatives in the chief manufacturing districts, as well as in Paris itself.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER TEN.

The re-introduction of several matters into this series, accompanied by some very lengthy observations, much beyond what was anticipated, has drawn this subject to an unexpected length, and has given to the whole a very desultory aspect, notwithstanding the lengthy interpolations alluded to are entirely pertinent to and intimately associated with the subject treated. The causes just named will, however, induce the writer to curtail his concluding observations; and he will do so with the less regret, as he has endeavored to lay before those readers who may have deemed his lucubrations worthy of perusal, as succinct and correct a statement as it was possible for him to procure of the results which were obtained by practical operations—only incidentally introducing those of a theoretical or experimental character. In this way, those interested in the subject will be able to form their own conclusions as to the feasibility or economy of employing any one or more of the methods noticed in connection with their own particular ores and surroundings. To reduce to a common standard, such as would readily be understood by ordinary readers, all the calculations of quantities, qualities and values of ores, which again become complexed by endeavoring to compare those only containing silver, such as those reduced at Freiberg, with those obtained at Washoe, which contain gold also, present such a series of network entanglements that, to explain thoroughly and minutely all the phases which the problem may assume, would require a moderately sized volume. Some of the more prominent variations, however, it is necessary to notice, foremost amongst which stands the subjects allied to

DRESSING AND CONCENTRATION.

It is the practice in this State to compare almost all matters relating to the reduction of gold and silver ores with what is adopted at Freiberg, as if the matter was not quite as well understood elsewhere. Mr. Kustel has done an acceptable piece of service by the publication, recently, of a work which largely treats upon the two subjects which form the above sub-heading, the necessity for which was shown by the writer eight or nine years ago; and until something better than the toy-like machine which have, up to the present time, been employed for the purpose on this coast, any serious step towards improvement and economy cannot be expected. On no subject connected with the mining and metallurgy of ores containing the precious metals, lead, copper and tin, alone or combined, has European improvements made such marked advances since the writer left that continent (thirteen years ago) as with the two subjects now under consideration, the chief of which does not date back so far as even years ago. These European improvements, with some modifications and adaptations, according to the variety of ore intended to be dressed, could be advantageously adopted in dressing both gold and silver-producing rock. In fact, one of the principal ones alluded to might have been claimed as a California, instead of a European invention, had skill, in place of ignorant inaptitude, been sought to supervise mines. Cases have arisen where some of the earlier improvements—such as the German adaptation of the Cardigan huddle (the origin of all this species of ore-dressers, and from which I obtained my early lessons)—after being perfected,

has been discarded, because the superintendent did not know how to use it. This specialty, and a most important one it is, has engaged far more of my thoughts and attention since my arrival in California, and has made more steps in advance since that period than all which relates to the chemico or metallurgical reduction of gold and silver ores. In the former branch, much opportunity remained for improvement, and there is still room for further modifications. In the latter, no new principle has been enunciated. All that now remains to be done is the judicious application of what has been long known and demonstrated—adapting the means according to the necessity of each case and the varying character of the ore to be treated.

CHARGES AND LOSSES ATTENDANT ON VARIOUS PROCESSES.

The causes referred to in the immediately preceding section furnished also the opportunity of collecting some straggling statements as to the cost and losses attendant on several of the modes under discussion. On the whole, however, they can generally only be deemed approximative and incomplete, so far as possessing any close comparison with what could or might have been attempted with gold and silver ores in the North America Sierra. It may also be observed that many of the statements given were based upon the earlier trials both of Augustin and Ziervogel, since which time some little economies have been made, the whole, however, not of any serious moment. Scarcely any of the data quoted can be considered other than approximative, and some, when compared with others, are very discrepant; some of which discrepancies will be pointed out.

Lamborne, who appears to have studied the extraction of silver in England, Saxony and other German States and the Austrian dominions, more systematically than any other person, gives the succeeding table of the cost and losses attendant on the treatment of one hundred weight of copper or copper matte by the following processes, in order to obtain the half pound of silver contained therein, viz:

	Cost.	Am't per cent. of silver left in matte.
By lixiviation.....	\$7 50	1.10
By amalgamation.....	3 75	1.17
By salt water.....	1 17	1.17
By warm water.....	1 37	1.34

Some unexplained error must occur in the above; otherwise the cost of the extraction of a ton, oven by Ziervogel's method, would amount to \$37.40, and about \$7.50 of silver be left in the residuary matter, or about \$45 per ton, when the two are combined, and this with a matte estimated to contain only about \$400 per ton. Lamborne further remarks that Ziervogel's method is only adapted to few localities. He says, and truly so, that "it can only be carried out with success where the ores are of a pure and unvarying character, as is the case with the mattes formed from the cupriforous schists at Mansfield. Very skillful and intelligent workmen are required, since the preliminary roasting is one of the most delicate operations in the metallurgy of silver."

It may be here remarked that in some parts of the Hartz, where arsenic, antimony, copper and silver are intimately associated with a quartzose gangue, the latter having been previously slagged off, the mode by lixiviation has been found more effective and economical than any other method yet devised. It may also be observed that the losses set forth are relatively too high, both for Augustin's and the barrel mode, each of which rarely amount to more than \$10 per ton, which, however, when added to the loss sustained in chlorinating, would form an aggregate loss of \$18 per ton. In another publication, Lamborne observes that when the lixiviated residues in the last named process are found to assay to the extent of 1-33 per cent. of silver, such residues are again sent to the furnace. He also states that when Ziervogel's method was tried at Freiberg, with furnace products containing arsenic and antimony, it was found that even when the utmost care was employed that 0.15 per cent. of silver (45 ounces per ton) remained in the tubs after the lixiviation was concluded. On the other hand, Augustin's method is much more successful when arsenic and antimony are present. The loss in such cases is greatly diminished as compared with the treatment by Ziervogel's method. Even, however, when the method employed is that adapted for each special variety, the minimum losses and charges cannot be assumed as amounting, for both causes, to less than \$15 per ton by Ziervogel's and Augustin's methods; and I believe that, with care, the barrel method will not amount to much more.

Salt Spring Valley and the Adjacent Region in Calaveras County.

[Read before the California Academy of Natural Sciences, December 16, 1867, by W. A. GODEFROY, Ph. B., Civil and Mining Engineer.]

[Continued from Page 50.]

The lithological character of the Gopher Hills is entirely different from that of Salt Spring Valley. They consist mainly of a pretty hard and tough, more or less coarsely crystalline, and dark-colored hornblende or pyroxenic rock, which is evidently metamorphic, probably of a grit or sandstone. Epidote is not uncommon in this rock, and calcite is occasionally found, though rare. Through most of this region the original stratification has been largely obscured, or nearly obliterated. Its general course, however, can still be traced without difficulty in the more or less elongated and flattened form and the general trend, which the rocky outcrops frequently assume when viewed from a little distance.

The texture of the rock varies considerably. In general it is rather coarsely crystalline; but not unfrequently it is much finer, or even compact; sometimes it is jointed. At one locality, in particular, ("Goodwin's," or "Sheep Ranch" Gulch) I noticed this jointed structure so well developed that a compact, almost imperishable rock could be quarried with facility, if desired, in nearly rectangular blocks and slabs.

It is not uncommon to find among these hills those peculiar holes in the rock which were hollowed out and used by the Indians as mortars in which to grind their food. I observed a number of similar holes in the hard rock, precisely in the bed of Rock Creek, in the ravine a short distance below the dam of the Salt Spring Valley Reservoir. It may be a question here, whether they owe their origin to the Indians or to the action of the stream, though from their peculiar deep and narrow form, I am inclined to ascribe them to the former. Heavy masses of flinty rock or hornstone also occur, particularly upon the southwest flanks of the range. This rock usually exhibits a much more distinct bedding than the ordinary mass of the hills. Its stratification is often perfectly regular, and sometimes the layers are beautifully thin and delicate. There is a very heavy outcrop of this finely banded rock in the ravine a short distance below the dam at Rock Creek. Higher up the hill, upon the road known as "Black's grade," another outcrop of the same formation has been cut across in building the road, and here a portion of the same flinty rock is thickly filled with fossils, which appear to belong either to some species of crinoids or facoids, though the structure is too much obliterated, and the specimens too much distorted to admit of definite recognition. They are apparently flattened in a direction parallel with the banding of the rock. From the general mode of occurrence of this hornstone, and from the frequent sharp and distinct lines of demarcation between it and the adjacent hornblende rock, it might be inferred that the former traversed the latter as veins, and the delicate banding of the rock, although parallel to the general stratification of the country, would not preclude such an assumption. But the fossils speak decidedly against it, and it is probable that the hornstone is a metamorphic form of fine sedimentary deposits, and that the banding is the result of the original stratification. Quartz veins occur here occasionally, and some of them at least are auriferous, though I know of none having been worked with profit hitherto. It is not improbable, however, that some of them may be found remunerative in the future, since many of the gulches among the hills here, in the early days of mining, were rich in placer gold. The degree of metamorphism throughout these hills has been very high; but I have seen no evidence of any direct igneous action;—at least no rock that I could identify as eruptive, with the single

exception, perhaps, of a small and apparently completely isolated body of well characterized granite, which occurs near the base of the Gopher Range, and between its highly metamorphosed rocks and the San Joaquin Valley, which is overlaid with tertiary and other recent formations. The occurrence of this patch of granite here, isolated as it seems from any other similar rock, is certainly a point of much interest; but I have not been able to study its relations. Its stratigraphical and topographical position is similar to that of the Folsom granite, and it may be connected with it in origin. If it should hereafter appear that there is a well characterized, though more or less interrupted line of granitic outcrop traceable throughout central California, along the lower foothills of the mountains, and west of the great belt of auriferous slates, it would have a most important bearing upon the theory of the general structure of the Sierra Nevada. The existence of such a line, indeed, might point to a very different, and perhaps more probable, *modus operandi* than that already suggested, by which the auriferous slates themselves may have reached their present position, and received their easterly dip.

One of the most interesting points connected with the geology of the Gopher Hills, is the auriferous belt in which occurs the "Quail Hill" mine, and of which I shall speak further presently.

Of the geology of Bear Mountain I know but little, having crossed it by but a single route. Where I have seen it, however, it consists largely of a similar rock to that which forms the mass of the Gopher Hills. Chromic iron is said to occur in considerable quantity at a certain locality in Bear Mountain, the exact whereabouts of which I could not learn. The slates of the valley extend, in general, completely up to the base of the Gopher and Bear Mountain ranges on either side, and sometimes a short distance up their flanks; but here the transition to the harder crystalline rock is usually quick and well marked.

Salt Spring Valley probably owes its existence, as such, entirely to inequality of denudation;—the comparatively friable slates yielding much more readily to mechanical action than the harder and more highly metamorphosed rock on either side, which has thus been left in the form of mountain ridges, projecting many hundreds of feet above the adjacent region, while the intervening and surrounding rock has been swept away to the plains below.

A partial description of the copper mines of Copperopolis will be found in the "Geology of California," Vol. I pp. 254-257. The depth of the main shaft in the "Union" is now stated to be a little over 500 feet, and the greatest depth reached in the "Keystone," is said to be 560 feet. All the deposits of ore here worked lie parallel with the strike and dip of the inclosing strata. The great ore mass of the "Union" mine forks or divides into two branches towards the northwest, and at the lowest depth now reached, its width or thickness, after having reached a maximum, is again diminishing. In the "Keystone" mine there have been two separate and nearly parallel bodies of ore worked to a considerable extent, and a third one was struck last spring previous to the suspension of work in the mine. The two main bodies of ore in this mine have "pinched out" or disappeared in various directions in their lines of strike and dip. They seem to have an irregular lenticular form, and, together with the great mass of the "Union," appear to lie in what are called "shoots," which pitch at an angle of 50° or 60° in the direction of the strike towards the northwest. The northwesterly prolongation of the strike of the great "Union" deposit does not coincide with either of the "Keystone" deposits, but passes east of them. There have been other and smaller deposits in the "Union" ground, more or less worked, lying west of the main body, some of which may possibly connect with the "Keystone" shoots, though the best information I could obtain leads me to think otherwise, and that they were probably isolated lenticular masses. The mass of the great deposit in the "Union" mine consists of an intimate mixture of chalcopryite and iron pyrites, containing on the average 16 to 17 per cent. of copper. Well defined selvages are not to be seen at Copperopolis, and the country rock is impregnated in all directions, sometimes to a considerable distance from the purer ore, with more or less finely disseminated copper and iron pyrites. In Europe it would pay to crush and work much of the wall rock itself for the copper which it contains; but here it is entirely worthless, as even 10 to 12 per cent. ore is not worth mining and shipping at present prices.

[To be Continued.]

Mechanical.

VULCANIZED RUBBER FOR WHEEL TIRES.

Engineering describes a novel experiment which has recently been tried by Mr. R. W. Thompson, Civil Engineer, of Edinburgh, the chief feature of which was the application of vulcanized rubber for wheel tires, on common steam carriages. The tires were made of india rubber, about twelve inches wide and five inches thick. Incredible as it may appear, this soft and elastic substance not only carried the great weight of the road steamer without injury, but passed over newly broken road material, broken flints, and all kinds of sharp things without leaving even a mark on the india rubber. The tires did not sink into the road in the least degree. They passed over stones lying on the surface without crushing them.

The india rubber tires require scarcely any more power to propel them over soft bad roads or over loose gravel roads than on the best paved streets. The reason of this is quite obvious; they do not sink into roads, and do not grind down the stones in the least degree.

The trials commenced by running the road steamer across a soft grass field, and it was afterwards taken across a part of the field which has just been covered with loose earth to the depth of one or two feet, and run straight across, and then back through the deep soft soil. The weight of the road steamer was between four and five tons; and yet the wheels, in passing over the loose earth, compressed it so little that a walking-stick could easily be pushed down in the track of the wheels without any exertion. After various evolutions, showing the ability of the steamer to run about where there were no roads, it passed out into the street, and, taking a large omnibus full of passengers in tow, proceeded up the Bonnington road to Messrs. Gibson and Walker's mills, where it took a large wagon, with its load of flour, about ten tons, up a steep lane full of holes and ruts, and rising with a gradient of one in twenty. It was obvious that the road steamer was able to do a great deal more than it had to do in this trial. The bite on the road is something marvelous, and the easy way in which it floated along on its soft and elastic tires was very curious. When riding on the road steamer, the feeling is like what would be experienced in driving over a smooth soft grass lawn. There is, absolutely, no jarring at all. There was no appearance of wear on the india-rubber tires. The original surface which the rubber had when it left the manufactory was still visible after its return. The engine is destined for Java, where it will be employed in drawing trains of wagons between two ports.

THE FIBER OF BOILER PLATES.—It is thought by many that the fibers of boiler plates should always be made to run with the curvature of the boiler. Fairbairn's experiments show a strength of twenty-three tons across the fibers, and twenty-one tons parallel to them; but the experiments of the Franklin Institute show little or no difference. The difference in favor of the fiber running with the curve is no doubt small; but there is a difference beyond doubt, and it would seem to be the part of wisdom and humanity to pay, at least, a small per cent. in favor of the greatest degree of safety. There may often be a little saved in cutting iron so as to ignore the direction of its fiber; but the increased risk in the reputation of the builder more than counterbalances the saving in cost. The Franklin Institute experiments, above alluded to, were made many years ago; since which time great changes have been introduced into the manufacture of iron, which might produce important modifications in the experiments, were they to be repeated at this time.

SHEET IRON RAILROAD SLEEPERS.—A curious plan for a temporary railway, to be laid for the benefit of the English forces in their excursion to Abyssinia, has been proposed by a Mr. Hadden. The peculiarity consists in making the sleepers of flattened cylinders of sheet iron, closed at one end, and which are to be filled with sand or gravel well packed. The sleepers are then to be laid on the ground with little or no ballast, and the rails secured to them by clip pieces, so as to be easily removed when desired.

STEEL PLATING RAILS.—The great superiority of steel over iron for railway bars, has led to quite extensive experiments for cheapening their production by welding a thin steel plate to the top of an iron rail. This experiment was at first thought to be a success, but time, which reveals all imperfections, has proved that a rail so prepared by the best process known at present, cannot be relied upon. The *Engineering*, however, thinks it may yet be done. We give below the remarks of that journal on this important matter:

None who have any faith in the future of invention and discovery would pretend to fix limits to the degree of improvement that may yet be attained in processes which, although already carried out with some success, are not yet satisfactory. It may yet be found practicable to make a perfect weld between a steel top and an iron stem of a railway bar; but this has not been thoroughly done yet. Many trials have been made, and it was for a long time believed by a number of engineers that the plan pursued at Crewe, of welding steel tops to iron stems, with an intervening layer of puddled iron, would secure perfect soundness. Unfortunately, this is not the case. The steel-topped rails in use on the London and North-Western railway have been found to show, after a time (and that often in warm weather), a slight crack between the steel and the iron at one point in their length. Once opened, each successive train extends this crack until the whole of the steel top comes off as if it had been fastened by some kind of cement rather than by welding. We have been shown large numbers of the tops which have so peeled off, and no doubt any gentleman really interested in knowing the facts will be shown the same discovered *caputs*, on application in the proper quarter.

STEEL RAIL.—The practical advantages of steel rails may be learned from the fact that the Boston and Providence Railroad Company have laid down 1,200 tons of steel rail upon their road. The experience of the company at Roxbury, where 120 trains pass daily, is sufficiently conclusive to warrant the expense of the change, since the iron rails at this point were required to be renewed seventeen times in one year, while the steel rails laid over a year ago have not been perceptibly affected by the constant traffic. Several roads in Pennsylvania have arrived at the same conclusion, and, being convinced that the increased expenditure is true economy, are making the change as fast as their resources will permit. When the substitution becomes general, accidents from the breaking of the rails will be prevented.

A BRITISH engineer has invented a rail of novel description. The new rail will be of steel and have a head and neck only, instead of being double-headed, as is the prevalent form. The rail will be supported on rolled iron "cheeks," which will form a continuous bearing, rendering the ordinary chairs unnecessary. The three pieces of which the rail consists, are bolted together by three-quarter inch steel bolts, eighteen inches apart. This new rail with steel head will not exceed in expense the ordinary double-headed iron rail in common use.

THE PARIS EXHIBITION.—ENGLISH OPINIONS.—Robert Mallet, F. R. S. of London, writes as follows of certain American inventions exhibited at the Paris Exposition.

Among the engines which possess more or less of interest departing widely from established types, may be mentioned several rotary engines, none of which even approach the solution of the difficulties inherent in this class, except one from America, which, however, is far from perfect. Also the strange, single-acting, high-pressure engines of Hicks, of the United States, in which the plunger pistons, by the aid of certain perforations and passages in them, are made to perform the functions of their own valves; and Andrews' (of the United States) oscillating high-pressure engine, with a curved faced slide, a segment of a cylinder described by a right line transverse to the cylinder by the oscillation of the latter. This engine actuates an American centrifugal pump, the construction of which is peculiar, and deserves attentive consideration. Centrifugal pumps present little beyond the old models seen in 1862 and at other times. The American centrifugal pump is an exception, however; as is also a centrifugal pump in the Swiss annexe.

Scientific Miscellany.

Impurities in the Atmosphere.

Rain water, even when caught direct from the clouds, contrary to common belief, is usually less pure than good spring water. Rain and snow in descending, absorb a notable amount of the various gases which are ever present in the atmosphere, and which arise from the combustion of fuel, and from the slow decay of organic matter. Even the nitrogen and oxygen, of which atmospheric air is composed, vary largely in their proportions, according as the air is moist or dry. The moisture of the atmosphere, moreover, aids it in taking up and retaining by absorption many gases, of which a greater or less amount is always present in the atmosphere.

Nitric acid is always formed by electrical discharges, the nitrogen of the air being thereby directly combined with its oxygen; and ammonia being present, as an exhalation from decaying organisms, nitrate of ammonia is also found. This latter substance has been found to exist in sufficient quantity in rain water to redden blue litmus paper. Snow may contain more nitric acid and more ammonia than rain, and hail more than either, for the reason that they are more readily absorbed by cold than heat.

Sulphuric acid is always present in the atmosphere in the vicinity of large cities where much coal is burned. So large is the amount of this acid in the atmospheres of London and Manchester, in England, that it even causes noticeable disintegration of the stones of which many of the buildings of those cities are built, especially where lime enters to any extent into their composition. Carbonic acid is also always present in the atmosphere, as a resultant from combustion.

Sulphureted hydrogen is also largely present in tropical atmospheres, where a large amount of vegetable decomposition is taking place. It is thought that iodine has also been detected in noxious fogs and mist. Marsh gas is found in the atmosphere of miasmatic regions.

A notable quantity of salt is always found in the air near the sea coast. This is readily proved by the analysis of the rain water caught in such localities. In the immediate vicinity of the sea, salt is found to be present in rain water to the extent of seven parts of salt to one million of water. One hundred miles from the sea that amount is reduced about one-half. The French chemist, Berral, estimates that fully sixteen pounds of salt descends annually on each acre of ground in the vicinity of Paris. Snow and hail always contain less salt than rain, from the fact that they are formed at greater elevations.

The above facts are quite sufficient to account for the impurity of rain water, and show how it may very readily contain a greater variety of impurities than those obtained by the percolation of water through the earth.

EFFECT OF ABSENCE OF SOUND.—Dr. H. Ralls Smith, of Louisville, Ky., by certain investigations, claims to have established the truth of the theory that animals living permanently in the Mammoth Cave of Kentucky, are not only without a trace of the optic nerve, but are also destitute of the sense of hearing. At one time he penetrated about four miles into the interior of the cave, and some 400 feet below the surface of the earth, the solitude and total absence of sound produced a very distressing and almost insupportable effect upon him, resulting in a very perceptible, although temporary, defection of hearing and aberration of mind. This explains the fact why persons lost in the cave for one, two, or three days have always been found, when rescued, in a state of temporary insanity. The mind and special senses, deprived of their natural pabulum and stimulus, gradually become weakened, paralyzed, atrophied, and finally as far as external manifestations are concerned, nearly, if not quite extinct. This fact may afford some clue to the cause of cretinism, a species of idiocy in the Alpine valleys.

Earthquake Waves.

The papers have lately announced the terrible destructive force of waves of the sea, produced by earthquakes in the West India Islands.

Professor Brocklesby, in his *Elements of Physical Geography*, states some facts of an interesting character in reference to the velocity of these waves. On the 22d of December, 1854, immediately after an earthquake, the sea rolled in upon the town of Simoda, in Japan, in a wave thirty feet high, overwhelming it in an instant. After the wave fell there were only four feet of water in the harbor. Four or five similar waves followed at intervals, completing the destruction of the town.

Professor Bache, of the Coast Survey, by observations made on the tide-gauges at San Francisco and San Diego, which registered all changes in the sea level, discovered that these earthquake waves at Simoda traveled across the Pacific. The distance from Simoda to San Francisco is 4,527 geographical miles, which was traversed by the waves in twelve hours and twenty-eight minutes, or with a velocity of six miles a minute. At San Diego, which is 4,917 miles distant from Simoda, the waves arrived an hour later, the velocity being sensibly the same. The curious fact is stated that the breadth of a wave, its velocity, and the depth of water in which it travels, have been found by Professor Airey to have a relation to one another. For example, a wave 100 feet broad, traveling in water 100 feet deep, has a velocity of 15 miles per hour; while a wave 10,000 feet broad, traveling the ocean with a depth of 10,000 feet, advances with a velocity of 154 miles per hour. So that, giving the velocity of a wave and its breadth, the depth of the water may be calculated. Professor Bache, from this data calculated a depth of the Atlantic and found it to be on an average of 22,000 feet, a result corresponding with soundings made.

The force of ocean waves have been calculated. During a storm on the western coast of Scotland, in March, 1845, the force of the waves was estimated at 6,000 pounds per square foot. It would seem that the immense wave, which like a wall thirty feet high, moving with resistless velocity, struck the ship of war *Monongahela* broadside, in the harbor of St. Thomas, and drove her from her moorings, forcing her over the tops of the warehouses, and leaving her, when the wave receded, high and dry on the coral reefs of the island, must have had a force even greater than 6,000 pounds to the square foot. If the ship had not yielded to the terrible impact of the water and moved shoreward, if she had been stationary and immovable, she must have been crushed like a cockle boat or a shell by the terrific blow given by the wave.

PECULIARITIES OF IRON.—Certain cast irons, identical in composition, are widely different in appearance, and give, when analyzed, quite diverse products. Again, there are certain cast irons of the same composition, as certain cast steels, and even steel which analysis can scarcely distinguish from certain iron. So noticeable are these facts, that in studying the metallurgical products of iron, its chemical composition is often but a secondary consideration.

The really dominant characteristic which exists between the properties of the various irons and steels, appear to be referable to the different degrees of oxidation in which the iron occurs in the ores from which it is extracted. So patent has this fact become, that the opinion is rapidly becoming general that steel should be made only from certain kinds of ores, which may be denominated steel ores; while the different kinds of iron should be made only from such ores as appear to give definite products, not interchangeable with each other.

These facts have led to the theory that iron in a metallic form possesses, at least, two allotropic conditions, somewhat analogous to the allotropic conditions of sulphur and of phosphorus.

A SUBSTITUTE FOR DISTILLED WATER.—A correspondent of the *British Journal of Photography* says, when in the wilds of Wales or Scotland, where it is difficult to obtain distilled water for photographic purposes, he hoiled the purest river or spring water he could find, and, after adding to every ounce a quarter of a grain of nitrate of silver, allowed it to stand, and when cold, filtered. This solution met every requirement.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and important inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

72,197.—**MACHINE FOR CUTTING OUT GLOVES.** Jesse H. Harlan and Thomas Pomeroy, Denver City, Col., assignors to themselves and Wm. H. Harlan.

We claim the adjustable knives of a glove cutter, when constructed and arranged substantially as shown and specified.

72,385.—**STRAP FASTENING.**—Rodmond Gibbons, San Francisco, Cal.:

I claim the hand-fastening, composed of the two plates or portions of plates, one plate having a tooth or long spur, which projects down into or towards a groove in the opposite plate, substantially as shown and described.

RECENT INVENTIONS.

A NEW QUARTZ MILL BATTERY.—Mr. D. J. McDonald, a millwright, of Virginia City, and for some time in the employ of the Hale & Norcross Company, has invented a new quartz battery, which is described by the *Territorial Enterprise* as follows: The stamps are all within a large harrel, which contains a flooring of inclined planes of chilled iron. As the harrel revolves, the stamps are raised to a height of six inches by the inclines, and dropping, fall upon the foot of the next incline and the ore upon it, which is reduced both by the direct blow of the felling stamp and by its sliding or grinding action in passing up the incline for another fall. Each harrel will contain a battery of six stamps. The ore is fed into the end of the barrel, and the pulp passes out through a screen, which forms the rim, and then is conducted to another harrel, fitted up somewhat like the first, but for grinding instead of stamping. In this harrel the amalgamation is done. Afterwards the pulp (waste) passes through revolving blanket sluices of an improved and peculiar style. The whole arrangement is of a novel character, and unlike anything we have ever seen. The machinery is of a nature so complicated that it would be useless to attempt a particular description. We have said enough to give the reader a tolerable idea of the plan of the battery, and to descend to minutiae would but confuse. Mr. McDonald is about taking the necessary steps for securing a patent for the whole mill, battery, amalgamating apparatus and blanket sluices. He is the inventor of an improved steam (or water) derrick, on every part of which he some time since obtained a patent. He will doubtless obtain a patent on his crusher, and perhaps on the whole of the machinery used in his mill.

A NEW MORTAR BOX FOR QUARTZ MILLS. The Eastern papers are making much ado about a new mortar box for quartz mills recently invented by Mr. George H. Nissen, of Christiania, Norway. The invention, says a Halifax paper, is likely to give a fresh impetus to quartz milling, not only here but in other countries, as it saves from 50 to 200 per cent. more gold than any known process that can be applied to the reduction of ores on a large scale. The discovery is the result of mature reflection and practical experience, Mr. Nissen having operated for many years as a miner, amalgamator and millwright on his own account in Colorado. The Orient Co., at Wine Harbor, were the first to test the value of the new mortar box, and so satisfied are they and other companies of the advantages to be gained by its use, that the inventor has already received orders for fitting up six mills, with an aggregate of 240 stamps, upon his improved principle; and there seems no doubt of its ultimate adoption by all quartz millers who consult their shareholders, and their own interest.

Of course no Californian, who has had any considerable experience in mining and milling machinery in California, will place any confidence in such an absurd statement as the above. The mortar box has very little to do with the ultimate saving of gold. It is possible, however, that that portion of the battery may be materially improved, and other advantages introduced for the gold-saving part of its work. The papers give no description of improvement.

A NEW RAILROAD INVENTION.—A car carrying its own track, and designed for use on common roads or the streets of a city, has been brought out in Philadelphia. In

this vehicle the car moves the wheels instead of the wheels moving the car, and the wheels do not touch the ground at all. There are six pairs of wheels, and each pair has a broad flat foot attached. These "feet" rest on the ground and bear up the wheels, while two rails under the body of the car are made to roll along the upper surface of the tire as if it were passing over so many pulleys or friction rollers. The feet and wheels are all connected by an endless chain, and as fast as the body of the car passes beyond one of these feet it is lifted from the ground and made to travel along to the front of the car, where it drops on the road again, and the whole is thus kept in continuous motion. The wheel track in fact "walks" along the road while the car itself rolls along over the wheels.

INGENIOUS CHAIN MACHINE.—A watch company in Rhode Island has invented a chain machine, which is one of the most ingenious and elaborate pieces of work ever devised. This machine takes the bar gold and transforms it, without noise, to the most delicate and substantial form and vest patterns.

A new style of row boat has just made its appearance on the Hudson, says the *Quebec Morning Chronicle*, and in it a man has been navigating Rondout creek. It is a curious looking craft, and resembles a ladder with pointed ends. It is composed of two tin tubes, air tight, about twenty feet long, fastened together about eighteen inches apart with light iron bars. The rower sits in the center, and skims over the water with great speed, guiding his odd-looking craft with much ease.

THE MECHANICS' MILLS, belonging to the estate of the late Mr. James Brokaw, have recently been purchased by a company of practical mechanics—employés, principally, of the establishment. The new corporation is known as the *Mechanics' Mill and Manufacturing Company*. Objects—the sawing and planing of lumber, and the manufacture of doors, eash, blinds, moldings, etc., together with every description of wood-work "finish" for buildings and steamboats. The establishment embraces six water-lots, four of which are situated on the south of Mission street, and two on the north, and between First and Fremont,—the cost of leasehold, buildings, machinery, etc., being in the neighborhood of \$25,000. It is a fact worthy of mention, as an indication of the thrift, energy and enterprise of the industrial classes of this city, that the entire amount of the purchase money was raised without placing any incumbrance upon the property of the Company or that of any of its members, the majority of whom are working men.

The only officer receiving a salary, as we are informed, is the manager, under whose supervision the business is conducted. Mr. Asa R. Wells, a well known leading mechanic in this branch of manufacture, has been elected to fill the above-mentioned position. Capital and labor are not necessarily antagonistic—they are absolutely dependent upon each other. When the former is wanting, a remedy is found, as in this instance, in the formation of joint stock companies or coöperative associations. Like the commingling of the waters of many rivelets, hundreds are swelled to millions, and a new impetus is given at once to both labor and productiveness.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SAN FRANCISCO LIFE INSURANCE CO.—Jan. 27th. Capital stock, \$100,000; 1,000 shares, \$100 each. Directors: C. G. Athearn, John Bamber, Henry A. Crane, John Center, Chas. N. Fox, J. Funkenstein, Nathaniel Gray, W. T. Garratt, Joseph Galloway, A. Himmelman, W. Holdredge, Theodore Meetz, J. J. McKinnon, Joseph Moore, M. Rosenbaum, H. Rosekrans and S. P. Taylor.

PIONEER AMERICAN FUR CO.—Jan. 28th. **NOE GARDEN HOMESTEAD ASSOCIATION.**—Jan. 29th. Capital stock, \$165,000; 368 shares, \$450 each. Trustees: Geo. Cofran, Wm. R. McKee, John S. Luty, George S. Crim, Isaac S. Allen, W. S. Urmy, R. P. Franklin, M. S. Osterhaus and Robert Mayers.

ELECTION OF OFFICERS.—**MARKETMEN AND RETAIL DEALERS' ASSOCIATION.**—Jan. 28th. President, B. M. Atchison; First Vice President, Peter Gaughran; Second Vice President, D. R. Avery; Third Vice President, Jas. Harvey; Recording Secretary, Ahram Moger; Financial Secretary, W. H. Eldridge; Treasurer, Samuel Foster; Sergeant-at-Arms, John E. Douglass.

JOHN B. GOUGH.—It is stated on good authority, that John B. Gough has entered into contract with Mr. Moody, of Boston, to deliver eighty lectures a year, for the next ten years, under his (Moody's) general direction. Mr. Moody is actively engaged in building up Young Men's Christian Associations; and the legitimate inference is that these eighty lectures a year will be given in behalf of that cause. Eighty lectures a year is about as much as a man of Mr. Gough's years can well undertake; so that we may infer that this distinguished orator will hereafter devote pretty much his entire energies and eloquence in aid of the spread of Christianity among the young men of our country. Mr. Gough is a power in aid of any cause in which he may engage. It is among the most pleasant memories connected with the early life of the editor of this paper, that he was one of the first to extend an encouraging hand and voice to Mr. Gough in his early efforts for reformation and usefulness. Meeting him accidentally on one occasion, at a small gathering of Westingtonians at a district school house in one of the smaller towns of Norfolk county, Mass., we were strongly impressed with the evidence which he exhibited of extraordinary native talent in public speaking, and took him to our home in the neighboring town of Dedham, with the view of persuading him to devote his entire energies in aid of the Temperance cause. Though persistent in his inability to be in anywise extensively useful, he finally consented to make the attempt, provided we would accompany him on a kind of experimental trip through the principal towns of the county. He insisted, however, on commencing at some of the smallest and most out-of-the-way localities. We well remember the effort it cost us, on one occasion, to persuade him of his ability to speak twice on the same day to the same audience, at a country temperance gathering. He consented to speak the second time only, at the most urgent importunities; distrusting his ability to get through with his second address, without too much repetition of the first. The result was a triumph; he produced a most decided impression.

Mr. Gough even then, never made any preparation for his addresses, but relied solely on the inspiration of the moment. Still more strongly impressed with the increasing evidence of talent which he evinced during this series of appointments, we advised him to enter upon a still wider field of labor, and soon after had the pleasure of introducing him to the care and patronage of that well known Apostle of Temperance, the late Deacon Grant, of Boston, under whose direction he soon took a high rank as a popular speaker, and developed that wonderful power of persuasive eloquence, which a few years later drew from Daniel Webster the remark that Mr. Gough was the greatest natural orator that ever lived. His subsequent career of usefulness, both in this country and Europe, is well known. We trust he will meet with equal success in the new and somewhat novel field of labor in which he has just engaged. May his life be spared, not only to complete, to its full, the engagement upon which he has just entered; but may he live to perform yet other and greater labors of love and mercy.

A RIVAL KING.—"King Cotton" has received a heavy blow and great discouragement in the New World lately, and some people are of opinion that he may as well abdicate. A discovery has lately been made in Missouri, which seems to offer a substitute for the cotton plant. The new plant is called the *ramie*, which gives a fine fiber of great strength, and glossy white, and it may be used for cloth, or combined with silk or wool. It is not affected by heavy rains, and endures heat as well as cotton. It yields eight hundred pounds per acre, and gives two crops in the year. The Mexicans grow it with great success, where the rains are much more prevalent than in our Southern States.

The Sacramento river is still about twenty feet above low water mark.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Smith.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Felton.*

After an careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hall.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text-books.—*James Leiman.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Hernon Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*L. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—*John Curry.*

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—*Charles A. Tullie.*

Its clearness and comprehensiveness make it easy.—*G. W. Dozier.*

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in media res." He seizes a sentence (which is the unit in composition, whether written or spoken,) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity as gradually that you do not feel the difficulty, and the thing done, you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Maryville Appeal.*

Not only one of the best of its kind, but what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Amador County.

From the *Ledger*, Jan. 25th: Last Sunday was "clean up" day at the Oneida mine, and it proved to be a good one. They have been running two weeks on what they term "prospect rock," and the result of the "run" was 615 ounces of gold, after being melted down, and is worth eleven thousand eight hundred dollars. There is no humming about this, we saw the amalgam before it was melted, and then the "brick" made out of it. Mr. Pringle, who is now in charge, informs us that within the past few days, by drifting north, they have struck another vein of rock far richer than any yet discovered, and that the ledge is about fourteen ft. wide.

On Thursday last, the Coney & Bigelow mill, at this place, was put in motion, after undergoing a thorough overhauling, and everything was found to work like a charm.

Butte County.

The *Oroville Record* says: New diggings have been struck near the Oroville race track within the past week or two, and parties have been very busy prospecting around in that vicinity. Many claims have been located, and shafts have been sunk to the depth of 15 or 20 ft. A strata of pay dirt has been found that prospects from 4 cents to one hit to the pan. There is no reason why that whole section of country should not afford profitable mining, for the river has been mined below it, and the valley between the new diggings and Rose station has afforded surface diggings for a number of years. The Forsyth boys had sunk a shaft to the depth of 15 or 20 feet, prior to the recent storms, and obtained an excellent prospect. Some 15 or 20 have been started, but the earth is so saturated with water that it is impossible to get down without the aid of pumps. Another Spring will undoubtedly see the whole country turned over.

Calaveras County.

Chronicle, Jan. 25th.: Paul & Co., after running a tunnel 900 feet in length, through solid bedrock, costing three years continuous labor, are now reaping a rich reward. Upon striking through into gravel their tunnel was found to be about 13 feet too high, necessitating the running an incline, up which the gravel is hauled with mules. The water which collects in the mine is removed by means of a syphon. A drift some 200 feet in length has been run directly on the lead, developing an immense body of exceedingly rich gravel.

At the "Coffee Mill" claim, they are taking out good pay dirt. A thousand car loads of auriferous gravel are already spread in the "drying yard." This mine is worked through an incline tunnel of great length, up which the gravel is hauled by a steam engine. Two tunnels have been run in the claim; the first one being too low.

Messrs. Prindle & Bowman have been compelled to partially suspend operations in consequence of the frequent breakages of the ditch which supplies their mill with water. They also evidently miscalculated the position of the lead in selecting the side for their shaft. As early as practicable in the Spring a new shaft will be sunk.

Mr. Shaw, proprietor of the old "Guy Claim," is knocking things "endwise." Under the powerful influence of a hydraulic pressure of 250 feet fall, Stockton ridge is melting away like grass before the mower.

In quartz we have no new discoveries to chronicle. Staples & Co., notwithstanding the bad weather, have persevered in the erection of their mill, and will be ready to commence operations on Monday next. Norton & Co. are progressing rapidly with the development of their claim. Alexander, Seavers & Co., in the same vicinity, are crushing rock with most satisfactory results.

San Andres *Register*, Jan. 25th: Mr. William Irvine has at last reached, in his excavation, a bed of the richest pay-dirt ever found upon the old "Blue Lead."

Amador Ledger, Jan. 25th: We learn that the mines at Cat Camp are all doing well—making from \$2.50 to \$10 per day to the hand, after paying for the water. There are about 300 white men and 200 Chinamen at work there now, and the number will be increased as soon as the water can be got in.

Nevada County.

Transcript, Jan. 21st: In several mining localities in this county, work has been suspended for several weeks for want of water, and in other places the great depth of snow prevents men from working. The damage to ditches, flumes and other works necessary to carry on mining, has been great, but the delay consequent upon repairing of

damages has been a very much greater loss to miners.

Jan. 23d: The miners in the vicinity of San Juan have had abundance of water, and the extensive hydraulic claims have been worked without interruption. The yield continues to be excellent.

Jan. 25th: The difficulties of the Jim mining company have all been settled. A new corporation has been organized under the name of the Mutual Gold and Silver Mining Co., which has assumed the liabilities of the Jim Company and paid the debts.

Gazette, Jan. 25th, Diamond Creek correspondence: But few of the miners are doing anything at present. The Salathiel Company, on the Mary Etta ledge, are not running the mill, having crushed all the rock they had out. In the upper tunnel they are taking out splendid rock.

Of gravel claims, there is only one working at present, which is owned by M. A. Singleton. He discovered the ground about a year ago, and has been working it ever since, whenever he could get water, the claim yielding at the rate of \$10 and \$12 per day to the hand.

Grass Valley National, Jan. 21st: At the Gold Hill mill there is now being crushed 500 loads of rock, from the Dromedary ledge. It is estimated that it will pay from \$30 to \$60 per ton.

Jan. 27th: A letter from Colfax says prospecting has been suspended until the storms are over. In quartz mining, the Rising Sun alone are prosecuting their work with vigor. They are now over 100 ft. below the surface. I have it from good authority, that they have found a rich and well-defined ledge.

Jan. 28th: The New York Hill Co. have given out several large contracts for mining tunnels in their mine.

Union, Jan. 24th: On the 17th inst., the stockholders of the Scandinavian mine held their annual election for Trustees. The election was an animated one, being a contest between the Smartsville and the Pleasant Valley shareholders—Pleasant Valley winning. The mine is looking well, and work is being pushed forward, night and day. We learn that measures are about being taken to increase the capital stock of the company.

Placer County.

Dutch Flat Enquirer, Jan. 25th: Most of the mining claims in this vicinity have been compelled to suspend work on account of the inclement weather.

Iowa Hill correspondence of the same: On Bird Flat, the old St. Lawrence mine is yielding tolerably well. The Dayton Co. have six to eight ft. of pay gravel. The dirt is rich.

Auburn Herald, Jan. 25th: The famous claim of McGonagle, Perry & Co. on the Black ledge, still continues to yield the ore. On last Saturday night's shift, some 10 or 12 lbs. of gold was taken out.

Work has been again commenced on the Green Emigrant claim by the original owners, and although at a different point from where it paid so handsomely, the surface prospects a bit to the shovelfull.

Plumas County.

Quincy Union, Jan. 11th: The Whitney mill will commence crushing quartz again next week. The company are taking out some very good rock.

The Caledonia mill at Cherokee cleaned up \$2,500 for last week's run.

The Crescent mine is still filled with water, and the mill is lying idle for the present.

Judkins & Kellogg have an abundance of water, are running all the stamps, the roads are in good condition, the mines free from water, and the quartz paying handsomely.

Shasta County.

Courier, Jan. 25th: McPherson & Co. are pushing along their fluming enterprise, at Piety Hill, with energy. We understand that when the main bedrock ditch is completed, several acres of mining ground can be worked through it. A portion of this ground is from 10 to 20 ft. in depth, and prospects well from top to bottom. The well dug to supply the village of Piety Hill with water is some 60 ft. deep, and the gravel taken from it prospected regularly all the way down.

Residents of Churntown say that times are duller there this winter than ever before known. The rains which fell during the early part of the season were so light as to produce but a temporary supply of water.

COLORADO.

Central City Register, Jan. 7th: Not for four years have there been so many mills running in Black Hawk as now. Every one that is fit to run is in use, crushing custom rock for from \$4.50 to about \$6 a ton. It costs, with everything cut close, about \$3 a ton, thus leaving a handsome margin for profit.

C. T. Sabin brought yesterday, 17 ozs. of fine gold, taken by Bertolani from 2½ tons of Coyote ore, Trail Creek.

The Powabic Co. are again crushing in Chicago mill at Black Hawk, and also supplying Jo. Kenyon with ore.

The Clark-Gardener Co. have got their new shaft down to a sufficient depth, 240 ft., to drain the old workings. The walls have been 11 ft. apart all the way, the rock crushed growing better constantly, paying at first only \$6 to \$8 a ton, the last crushed yielding nearly as much again.

We have seen a hutton of silver weighing 18 ozs. taken by Mr. Kirkland from 100 lbs. of Young America ore.

Yesterday claims Nos. 1 and 3 W. on the Topeka, 1 E. on the Junction, and 6 E. on the Saratoga were sold by Mr. Atkins, under a decision in chancery, on the street. Mr. Sayre bought them at \$18,500.

The shipments of gold from Central City during December, 1897, per Wells, Fargo & Co's express, amounted to \$118,662. It has nearly all been taken out by stamps.

Mr. Conlee is working five shafts on the Kansas and Burroughs lodes, but his ore principally comes from the bottom of the Gilpin Co. property. Last week he mined and hired crushed, at a cost of \$5 for mining, and \$7.50 for hauling and crushing, 175 tons, the same producing \$18.50, currency, per ton. About five per cent. of the best ore was saved for the smelters. Mr. Conlee designs to employ the N. Y. mill. Peregrine's, the Sterling, and Mendell's, 80 stamps in all, steadily from this on. They will crush about 240 tons a week, which will yield from \$15 to \$20. About seven per cent., 16½ tons, estimated to be worth \$100 a ton, will be saved for the smelters.

The Gilpin Co. was organized four years ago, sent an agent of experience in mines. He expended in the course of about three years, \$60,000 for the company, never realized a dollar from the property; but on the contrary, damaged it as we are informed, to the amount of \$10,000. He was finally relieved, and the property laid idle up to a recent date, when the company leased it to Mr. Conlee, with the result above stated. This goes to prove that gold quartz mining in Colorado has been a comparative failure during the last three or four years only because of the most outrageous and incomprehensible mismanagement.

Georgetown Miner, Jan. 9th: Mining items are scarce during the present inclement weather. Work, however, on lodes that are provided with shaft houses is being actively prosecuted.

Garrott, Martine & Co. will start their mill again when the weather moderates.

We learn that Messrs. King & Hill have struck the east extension of the celebrated Herkimer lode.

DACOTAH.

Gold Hill News, Jan. 20th: By mail from the east we have received the prospectus of a new paper to be called the *Sweetwater Mines*, and to be published at South Pass City, Dacotah Territory, by Warren & Hazard. The paper will be issued tri-weekly. The prospectus says confidently: "Within the past six months a gold mining country has been discovered on the Sweetwater river and its tributaries, near the South Pass, that for richness surpasses anything of the kind ever found on the American continent, and so far as prospected, second to none in the world. The wonderful discoveries of both gold quartz and placer mines during the past four months warrant us in thinking that within the next 12 months a population of at least 50,000 people will be found where only in July last 'Poor Lo' beld supreme sway. The section contains several of the largest and finest agricultural valleys in the western country, beautiful, and the climate without a superior."

IDAHO.

World, Jan. 15th: Yesterday a party of four came in from Deadwood Basin on snow shoes. Snow is only about three feet deep in the basin, and those camping there have plenty of everything for the winter. The prospects for the ensuing mining season are very gratifying, and one ditch, of 6¼ miles length, has been completed.

Over one million in treasure has been shipped from this city to San Francisco through Wells, Fargo & Co. during the year just ended. An equal amount must have been taken away by parties assuming their own risk; and a large amount by packers, teamsters and produce dealers. Altogether, we do not hesitate to venture the statement that fully two and a half million dollars, in gold dust and bars, the product of this basin alone, has been taken from here during the past year.

Correspondence of the *Boise Statesman*, dated Dec. 31st: In Yuba district there will be two 20-stamp quartz mills erected next season. At Rocky Bar, the tunnel of the Red Warrior, 350 ft. deep, is finished, and strikes

the ledge 110 ft. below the surface, with a shaft run from the old tunnel, 60 ft. above, down to it. The ledge is 12 ft. wide. A drift 40 ft. east discovered a mass of splendid quartz. The writer speaks very favorably of the Casco, or Wide West, the Confederate Star, the Ida Elmore, the Pittsburgh, the Golden Star, and the Idaho ledges.

Owyhee Avalanche, Jan. 18th: Very rich gold bearing quartz has been struck in the Woodstock mine, in the tunnel which is being run to tap the main shaft at the bottom. Only about 10 ft. remain to be run in order to complete the connection, work having been vigorously pushed forward from the bottom of the shaft, as well as from the outside.

Trask & Son have their new arastra building about completed. It is 28 ft. in width, and 60 in length. The wheel will be an overshot, 33 ft. in diameter, and will be run by water from Webfoot Gulch. A common arastra will be put in operation early in the spring, but it is the intention to substitute stamps next summer.

From Jan. 1st to the 16th, 800 tons of quartz have been hauled to the different mills from the Oro Fino, Golden Chariot and Ida Elmore mines. During the same time it is estimated 600 tons of ore from the Poorman have been delivered at the Owyhee mill—making an aggregate of 1,400 tons.

The Poorman is paying handsomely at present. The ore worked at the Owyhee mill yields 75 lbs. of bullion per day, after being retorted and made into bricks.

We stated last week that 50 tons of Ida Elmore quartz were at the Webfoot mill, instead of which we should have said 50 tons of Oro Fino.

MONTANA.

Post, Jan. 11th: Helena items: A new lead has lately been discovered near the Atlantic Cable lode, which is said to be much richer than even that celebrated lode. The lead was struck by Messrs. Thomas & Co., and it has a crevice 15 ft. wide. Specimens of the rock are on exhibition, which show considerable free gold.

We understand that Col. Henry Allen has formed three large companies, to operate in the Ten Mile district—one in St. Louis, one in Boston and one in New York—all of which will bring out machinery and ample means to prosecute their labors. In addition to these, Prof. Swallow designs bringing out three mills and a smelter; one of the mills to be put up in Highland, the second in Ten Mile, and the third mill, together with the smelter, is to be located at Butte City.

The Mansfield Mining Co. have lately applied in the U. S. Land Office for a patent to their property. It comprises 200 ft. on the Union No. 2 lode, being one-half of No. 2 east and an undivided one-half of No. 4 east from discovery claim.

NEVADA.

Humboldt.

Register, Jan. 18th: The Pioneer mill has had a hard struggle this week to keep its wheels in motion, owing to the large accumulation of ice on the flume and water wheel, but "it still lives."

Pahranaagat.

Austin Reville, Jan. 17th: The Pioneer Foundry of this city has just finished the necessary iron work for the reverberatory 10-stamp mill at Hiko, Pahranaagat, and they will be sent forward to-day or to-morrow.

We are informed by Benj. Evans that shortly before he left Hiko, specimens of silver ore had been brought in there from the Mountain Meadows, about 100 miles southeast, where prospectors had discovered and located a number of ledges. The ore exhibits a large proportion of galena. It is said by the recent discoverers that the mines were located and worked by the Mexicans many years ago, of which the ground bears present evidence in piles of debris and remains of furnaces. Mr. Evans says that the men who brought the specimens to Hiko represent the ledges to be large and numerous.

Reese River.

Reville, Jan. 22d: We were shown this morning the certified result of the working of 18½ tons of sulphuret ore from the Magnolia mine. The ore was reduced at the Maubattan mill, and the pulp assayed at the rate of \$404.53 of silver per ton. After paying mill charges, revenue tax, stamps, etc., the 18½ tons afforded the sum of \$5,518.46 in gold coin. Mr. A. Morse, the agent of the company, arrived here a few months ago. Instead of running counter to Supt. Clark and playing a cross purposes with him, he has from the first seconded his efforts to bring the mines of the company to fruit. The Magnolia had long been regarded as one of the most likely mines of Lander Hill, but the attempt to work it by a board of trustees

seated upon the Atlantic seaboard proved a failure.

Same of 23d: By a person just arrived from Newark district, we have been informed that the mill of the Centenary Co. was at work producing bullion, though it will be closed before long for want of salt, its supply of which can scarcely be replenished before next spring. The Chihnahna and Lincoln mines of the company are being worked steadily, and their appearance is cheering.

Correspondence of the *Enterprise*, Belmont, Jan. 17th: Our large Combination mill is at length completed, and will start its powerful works in two or three days. I have no doubt of its success. We will ship bullion shortly that will astonish the world. I have examined their mine, and find it the best ledge in the State, but not developed as yet. There are a large number of tons of rich ore hoisted daily. I think this will be the busiest camp in the State the coming spring. Canfield is going to start his works and mill very soon. There are a number of good ledges here, but they are in the hands of poor men. We want a custom mill. Should we get a good mill, we will be independent of these rich companies and their labor.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Jan. 24th: The Reek Point Mill Co. have almost completed a new dam in the place of the one swept away by the late flood in Carson river. In a few days the dam will be finished, and the mill will resume work with both steam and water as a motive power. The Illinois Mill Co. are getting in a supply of ore for reduction and will soon start up. The mill is run by steam. There are a number of idle mills in Dayton and above on the river.

A cave of considerable extent occurred yesterday in the Yellow Jacket mine, south, but no particular damage was done, as the mine at the point where the cave took place was worked out.

Same of 25th: Owing to the great depth of snow upon Cedar Hill, no ore is being brought down from the Sacramento mine. The tests of the ores taken out a month or two since were very satisfactory.

The Empire-Imperial works have resumed operations, having received and put in place their new spur-wheel.

From the office of Wells, Fargo & Co., in this city, during the past week, there were shipped 1,420 lbs. assayed bullion, valued at \$27,121.64.

Trespass, Jan. 25th: In the Ophir, work continues at the shaft as usual. In the Gould & Curry, the usual quantity of ore is being taken from the old station. In the Savage, the connection between the winze and fourth station was made early in the week, the ore at that point being from 19 to 24 ft. in width, and of average quality. In the north mine, fourth station, northwest drift, a vein of ore was cut last Wednesday that was one foot in width. It has been run on, and has widened to 4 ft., with promise of continuity. It is very fair in quality. In the fifth station, middle mine, a body of quartz was cut, and with it a considerable vein of water. The dividend for this month will be \$5, with a handsome amount to carry over. In the Hale & Norcross, the body of ore mentioned in our last, next to the Savage ground, continues to look well, and is of an average width of 18 ft., and will mill \$50 per ton. In drifting west of this body, another vein of fine ore was cut on Thursday, supposed to be the same body—making down from the old winze. In the Imperial, the new machinery is now in working order, and steam was made last night at the Imperial-Empire shaft. This morning active work has commenced in draining the shaft. In the Yellow Jacket, the labor of letting down the pump column continues, and new rods for the upper pump have been substituted for the old ones. At the foot of the winze on the Kentuck line, a drift south to connect with the advancing drift from the 700-ft. level of the Crown Point, has been commenced. About 70 tons of ore are being mined daily, the principal portion of which has been mined from the north shaft. In Kentuck, the usual amount of ore is being taken out. In Crown Point, the station timbers at the 800-ft. level have been cut, and a drift east has been commenced.

Geld Hill News, Jan. 19th: The Bowers and Plato mine is again in full blast. C. C. Stevenson is the superintendent.

Flax.—A farmer in Humboldt county, the past season, sowed on a piece of land measuring twenty rods, eight and a half pounds of flax seed, which yielded 120 pounds of clean seed.

The Mining Academies of Saxony and Hungary.

The subject of establishing a School of Mines on this coast, being at the present time a prominent general topic, and one which will continue to be so for some time to come, we purpose inserting, at length, an excellent article under the above caption, which appeared several years ago in the *Memoirs of the Geological Survey of Great Britain*. The paper was drawn up by Prof. Warrington W. Smyth, the mining geologist connected with that Survey. When completed, some additional remarks or continuation of the same will probably be given to our readers from the pen of a gentleman well acquainted with the subject. We do not think the reader, after the perusal of the present article, will deem that any great accession of knowledge will be obtained by sending any person devoid of a thorough mining and metallurgical education, as a Commissioner to glean information likely to be overlooked by so competent an observer and writer as Professor Smyth. The paper we copy was directly addressed to the inhabitants of Great Britain; but if the reader will mentally substitute the United States for the old country, the remarks will be found just as pertinent as though they were addressed directly to the citizens of the United States:

"Among the various applications of geology to the useful purposes of life, the art of mining most directly needs the application of that science, and requires, for the successful furtherance of its views, the most extended acquaintance with the geological facts observed at different times, and in different places.

Every thinking miner must, indeed, in a certain sense, though perhaps in a very confined sphere, become a geologist; little as the practical coal-viewer or mining agent may be prepared to receive the title:—and he bases his operations, whether relating to the discovery of new mineral treasures, or to the prosecution of those already found, on rules which the experience of years has taught him to lay down; and in proportion to the strength of his judgement, the retentiveness of his memory, and the opportunities of seeing and testing which have been afforded him, will he be likely to carry out advantageously the work on which he is engaged.

Looking at the class of men who, in this kingdom, are intrusted with the direction of collieries and mines, we find them, in general, characterized by a remarkable degree of energy and intelligence; and yet it cannot be denied that, independently of the losses entailed by the uncertainty of mineral veins, large sums are yearly squandered on ill-judged, and sometimes even absurd speculations, which a greater amount of experience, on the part of the proposer, would have taught him to modify or abandon. We cannot be surprised to hear of similar failures, when we consider, first, the comparatively short time over which a single man can extend his experiences; secondly, the great amount of phenomena which must be observed and compared to form a ground-work for practical geology; and, thirdly, the numerous branches of other arts and sciences, some of which should properly precede its study, whilst others, immediately connected with the duties of the mining agent, intervene to distract his attention, and render it difficult for him to attain a great degree of proficiency in any one particular subject.

On the continent of Europe several academies have been founded with the desirable object of supplying to miners a knowledge of geology, and the kindred sciences, and of establishing a storehouse of facts and experience, whence they should be enabled to reap the harvest sown by those who have gone before them, and should set forward on their own career provided with such a stock of knowledge as to obviate the necessity of passing a great portion of their lives in the useless repetition of that which has been done before; and with the view of affording them a facility, by beginning where others have ended—to form new links in the chain of improvement, and thus to carry out the process by which alone, in every pursuit, we can hope to approach perfection.

To argue at length for the advantages of such a system would be here out of place;

no man will deny the justice of the observation of the Roman poet—

"Ego nec studium sine divite vena
Nec rude quid possit video ingulum."

And a suitable direction of the mind, and early exercised acquaintance with established principles, is surely no less necessary to the successful cultivation of the useful arts, than to the ornamental branch of literature.

The most remarkable of these mining colleges are those of Freiberg, in Saxony, and Schemnitz, in Hungary, because both situated in the center of important mining and metallurgical operations, and therefore combining the advantages of general scientific instruction with the practical application of the art. As we account, however, of their plan and working has been laid before the public since the days when the name of the first-mentioned academy resounded throughout Europe, in connection with that of its celebrated Professor, Werner, I believe a short description will prove interesting to the miner as well as the metallurgist and mine-adventurer; and since I had the opportunity of residing at each for some months in the years 1840 and 1842, and of hearing certain courses of lectures, as well as of examining the works of the surrounding districts, the information will apply nearly to the present date.

The want of an academy for educating the miners of Saxony was made apparent by the number of young men who flocked to Freiberg as pupils of Dr. Henckel, and in his house heard lectures on all the necessary subjects; whilst in the neighborhood they were provided with the means of gaining practical experience. On his death, in 1744, students still visited the town; and at length, in 1765, a mining school was founded by Prince Xaver, during the minority of the King, which very soon, under the care of Werner, who was appointed inspector in 1775, attained great celebrity. His perfect acquaintance with the sciences on which he lectured, his activity of mind, and his excellent manner of teaching, caused his classrooms to be frequented by strangers from all quarters. He every year read lectures on the art of mining, mineralogy, and geology, as well as on iron smelting, fossil remains, mineralogical literature, geography, etc.

These subjects have, since his time, been so amplified as to afford sufficient occupation to several Professors, and were distributed in 1840 as follows: General Chemistry; Technical Chemistry; Metallurgy; Mineralogy and Mineralogical exercises; Geology in two courses; Crystallography; Physics (Natural Philosophy); Paleontology; Pure Mathematics; Higher Mathematics; Mining Jurisprudence and Correspondence; Analytical Preparation; Analytical Chemistry; Applied Mathematics; Mining Machinery; General Surveying and Practical Geometry; Art of Mining; Surveying; Drawing, in three divisions; Architecture; Assaying of Metals; French Language.

The institution is placed under the immediate control of the upper board of mines (*Oberbergamt*); the Professors, although forming no regular senate, meet on occasion in conference, where the members of the above board also sometimes take a part. The superintendence of the discipline is intrusted specially to one Professor.

Candidates for admission must produce certificates of healthy constitution, good character, and tolerable proficiency in the usual subjects of school education, and in mathematics. The testimonials are presented between January and June; and the *Oberbergamt* decides upon the candidates who may present themselves for the examination, which takes place in August. Those who are supported by the government have the advantage of attending the lectures gratuitously, and receive certain *stipendia* or scholarships; they are divided into two classes; the first, called the *Beneficiarii*, pass through a course of four years, and become candidates for the royal service; the other is composed of those who enter for places not requiring more than one or two years of study, or who are unable to enter as regular pupils in consequence of a want of vacancies in the corps. Independently of these, are Saxons, who pay their own expenses; and foreigners. Some of the academists, finally, go to the University of Leipzig to study jurisprudence, which is necessary for those who are to be officers in the various mining towns of Saxony. Another part, who have distinguished themselves for intelligence and industry, are sent to travel at the expense of the government, or to visit foreign universities.

Saxons, in good circumstances, and foreigners can attend the academy on production of certificates of good character, and of their stay being duly authorized; they are

*I dare not what either study or untutored genius can accomplish, without rich veins of material.

expected, however, to pay for the courses of lectures as follows: General Chemistry, Analytical Chemistry, Mineralogy, the Higher Mathematics, and Machinery, each \$30* per annum. Geology, Physics, Applied Mathematics, Pure Mathematics, Metallurgy, Technical Chemistry, Architecture, \$20 per annum. Art of Mining (two parts), Elementary Mineralogy, Mining Jurisprudence and Correspondence, Theoretical Surveying, \$15 per annum. Practical Surveying, Assaying and Drawing, according to circumstances.

The students of this class are entirely free from the superintendence of the officers of the academy, and only attend the examinations if they require certificates; their number is usually about twenty, of whom three or four are officers of the Russian Mining Engineers sent by their government to reap the advantages of extended experience, whilst others are from Spain, Brazil, the smaller German States, etc.

The subjects are taught as in our own Universities, by lectures illustrated by figures on the blackboard, by experiments and by the inspection of specimens, according to the nature of the case. One day in the week (Monday) is left without lectures to enable the students to visit the works, or take part in the operations.

The ordinary pupils are expected to keep a fair copy of their notes, and are examined at least every month as well as at the close of the annual course of lectures, and are classified and rewarded according to the result.

On the expiration of the second year, the student determines whether he will attach himself more particularly to the mining or the metallurgical departments; and then pursues a course of study more especially adapted to his end. In the fourth year, practical exercises in both branches form the main feature of the course of education.

The Academic or Mining School, an establishment subordinate to the above, is intended partly to educate youths of a lower class for the situations of under-managers and viewers—partly as a preparatory step to the Academy. The number of scholars is restricted to 40, and they are instructed in arithmetic, geometry, the art of mining, elementary mineralogy, German grammar, and drawing, the whole course being arranged with a view to the combination of practice with a correct knowledge of principles.

A handsome building, in the center of the town, has been erected for the use of the academy; it contains several lecture-rooms, an excellent library, to which the students are liberally admitted: a room appropriated to mining and mechanical models, and extensive and well-arranged collections of mineralogical and geological specimens.

*The Saxon dollar is equal to 3s. sterling.

A CURIOUS MACHINE.—Mr. Norton's marvellous invention for discovering the existence of water on the most arid land, is attracting immense attention in Paris, and experiments are daily made with it in the neighborhood of Paris. The Emperor Napoleon has purchased the machine, and personally superintends the experiments going on in the Park of St. Cloud. The instrument consists of a long iron tube, terminating in a sharp point, which, forced into the ground, has never failed within twenty minutes to bring water to the surface.

Paris Correspondence.

The above mentioned "Machine" is the Avery Tube Well and Pump, which was illustrated in our last issue, and the advertisement of which will be found in another column. It is really a most important and valuable invention.

A PAPER MILL IN THE SIERRAS.—It is said that a paper mill is to be erected on the Truckee river, in which a capital of \$300,000 is to be invested. This point has been selected on account of the pure water which can be obtained there, and for the reason of its proximity to the Pacific Railroad. The immense district of country beyond the Sierras will soon furnish an ample market for such a manufacture. The parties engaged in the enterprise are said to be Eastern capitalists.

STEAM POWER IN HYDRAULIC MINING.—

The *American Journal of Mining*, in noticing the claim put forth that the recent application of steam by Mr. Samuel Fair, of Nevada county, to propelling a water jet for hydraulic mining is something novel, says that such use of steam is not new. The same device has been for some time employed at a placer mine in North Carolina, reference to which was made in the *Journal of Mining* of the 23d of November last.

Mining and Scientific Press.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.
Mr. C. T. Hancey is our duly authorized agent for Sacramento County. Nov. 29, 1867.Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.
Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

OUR NEW YORK AGENCY.—Mr. M. A. LATHROP, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No. 725 Broadway, for the present. Nov. 26, 1867.

San Francisco:

Saturday Morning, Feb. 1, 1868.

Notices to Correspondents.

AQUARIUS, Sacramento.—The gentleman you refer to as the writer of a series of articles which appeared in 1862 in the *Sacramento Union*, and we believe also in a more condensed form in the *Evening Bulletin*, in reference to the causes of the floods then, subsequently and now devastating the central valley of California, and their mode of prevention, and Prof. Rowlandson, the writer of several articles on metallurgy, mining and geology, in the MINING AND SCIENTIFIC PRESS, is one and the same person. Prof. Rowlandson, at the time of the floods of 1862, then declared most emphatically that the levee system for the reclamation of swamp lands would prove an utter failure; and further that the future security of Sacramento from inundation would, under like circumstances, depend chiefly upon such failure. The present season has shown the perfect soundness of Prof. R.'s conclusion; for, had the levees, erected with the ostensible purpose of securing the swamp lands, which they inclosed, from overflow, withstood the recent floods, Sacramento must again have become submerged. When the Legislature was temporarily domiciled in 1862 in this city, Prof. R. had interviews with the then Governor (Leland Stanford) and several senators and members of the Assembly, with the object of making a survey and preparing plans and a report for the ensuing Legislature, as to the most advisable plan of procedure, the cost of which was estimated would amount to \$15,000. As, however, such an expenditure possessed no room for jobbing, by idle politicians; but on the contrary had a tendency to displace such, and had no view for obtaining any franchise to the injury of the State generally, the object was so coolly received that it was not deemed prudent to press the matter forward. We would like some member, of either House, to move a call for the amount and particulars of the expenditure made of the Swamp Land funds, since the period alluded to; all of which, it is now proven, have been as useless as though the money had been thrown into the Pacific. Ex-Governor Low was most probably in error when he stated that no feasible plan for the prevention of destructive floods and the permanent reclamation of the swamp lands had ever been submitted.

J. D., Pioneer City, Idaho, will have found before this reaches him, that the error of \$13.33 in place of \$1,333 per ton obtained from ore worked at the Miners' Foundry, the produce of the Duncan extension, was rectified in the succeeding week's publication. Before our next issue appears, we will take the opportunity of looking at the 600 pounds of similar sulphurets now in the hands of Messrs. Rogers, Meyer & Co.

F.—A is received, and will be replied to next week.

SILK STATISTICS.—A correspondent of the *Sacramento Union*, of Wednesday last, takes exceptions to an article which appeared in our issue of the 18th ult., in relation to silk culture in this State. The correspondent in question labors under a mistake in supposing the article to have been original in the Press. It was distinctly credited to the *Commercial Herald* of this city, to whose attention we commend the matter.

The Black Rock Mines.

Mr. Hiskey, a millman, who has lately worked some of the ore from the Black Rock mines, complains in a communication to the *Sage Brush*, of our depreciatory remarks with reference to the Black Rock mines, and says: "I have said I believed Black Rock was and would prove the richest district known. I believe I can prove it, and if nothing happens more than I know of at present, I will prove it." We again repeat the hope, already so strongly expressed in our former article, that the Black Rock mines may prove a success. Our depreciatory remarks were founded (and so stated at the time to be) upon a large quantity of specimens, from what are generally reported to be the most promising mines in the Black Rock district. With two exceptions, out of a representation of some twenty mines, we pronounced the specimens, so far as mere judgment could go, totally barren of either gold or silver. Of course if they are fair representations of the mines in question, as claimed, those mines must be as valueless as the specimens. We did not, neither do we now say, that valuable mines may not exist, or may not even now be known in that district; yet we do not believe that either Mr. Hiskey, or any other man, ever found gold or silver in paying quantities in any such specimens as have been submitted to our inspection, unless it was put there by human agency. We should heartily rejoice at being able to chronicle any favorable developments at the Black Rock mines; but we protest against the hawking about the country of volcanic debris (of which the specimens we have seen chiefly consist) as samples of rich ores, with the view, thereby, of deceiving the public into making investments in worthless mining stock.

Since writing the above, we have met with the following paragraph from the *Carson Appeal*:

"We will state what our experience is with regard to the 'black wax' of the Black Rock district. About a year ago the editor of the *Appeal* filled a small box with specimens of ores, etc., from the various localities in this State and sent them as a present to Prof. A. E. Verrill of the Sheffield Scientific Institute, Yale College, and among these specimens was some of this 'black wax.' The Professor's special attention was directed to this strange substance, and he was requested to examine it and give his opinion of what it was. In a letter dated 'New Haven, Conn., March 31st, 1867,' Prof. Verrill says of the 'wax':"

"It contains a little silver, but not near so much as you say it is reported to. It is a sort of clay, containing some chloride of silver, salt, bitumen, etc.—the result of the decomposition of rocks and minerals containing ores of silver, etc. We are now having a more accurate assay made of it, and I will report the result as soon as completed."

"It will be seen by this statement that the 'black wax' does contain a little silver, although not so much as it had been reported to contain. (Prof. Verrill was informed that it had been said to have yielded \$700 and upwards on assay). The result of the second assay has never been reported to us. But the fact that it had been made to show traces of silver is a pretty good proof in support of Isenbeck's statement. At any rate we can vouch for it that Prof. Verrill's report is an entirely candid and disinterested one. Should we get his report of the second assay, we will make it public."

The "black wax" is among the mineral already alluded to in the former portion of this article. It is possible that it may contain a trace of silver, as nearly all the vein rocks of Nevada do; but we do not see in that fact any confirmation of the statements that it will yield \$700 to the ton, or silver in any paying quantity whatever. This, we believe, is the rock upon which the largest expectations were based. We had considered it a volcanic production—its origin may be solfataric. The analysis of Prof. Verrill confirms us in the latter opinion, with regard to its origin, rather than its derivation from the decomposition of rocks upon the surface.

In connection with the above, we quote

the following from the *Sage Brush* of July 18th:

Judge Harrison and A. C. Lengmere returned to Susanville on Thursday of this week from Black Rock. They report the experimenting at the two mills erected there to be quite shorn of any encouraging results. Cheatham had failed to find the color, and was looking for the advent of Hiskey. Salt, of which they are said to be in need, had been procured at Summit Lake, and all the appliances that could be required were at hand, ready for the operator. It seems as though every move to solve the Black Rock enigma clothed it with a still greater mystery. On the evidence adduced in Washoe and Virginia, by working process as well as the declarations of their principal practical mill operators, operations there have been pushed forward, mills constructed and a vast amount of time and capital expended, with apparently no result of a favorable character.

We trust that after this call, Mr. Hiskey will come forward, and make good the opinion expressed by him, as quoted at the outset of this article.

California Academy of Sciences and Yerba Buena Park.

The California Academy of Sciences have made application, through the Board of Supervisors, for the use of a portion of Yerba Buena Park, on which to erect a building suitable for the accommodation of that institution—one in which its museum and library may be located, and which may contain suitable rooms for its regular meetings, an audience room for public lectures, etc.; also for the setting apart of a further portion of the ground for a scientific and botanical garden. Such a disposition of the grounds will not in any way affect their dedication and use for a public park; but, on the contrary, would greatly enhance their value for such a purpose, as the gardens would always be open and free to all, and the building and collections would likewise be free, within certain reasonable restrictions, as to time, etc. The use, simply, and not the fee to the land, is asked for.

A similar project is being carried out in Philadelphia, where an ordinance was passed, on the 24th of October last, to donate the use of Penn Square, one of the largest and best located in that city, to the Philadelphia Academy of Sciences, the Philosophical Society, the Academy of Fine Arts, the Franklin Institute, and others, and before the ordinance passed, a citizen offered to donate \$10,000 towards the erection of buildings. When the matter was under consideration, Councilman Willets said:

"Philadelphia must keep up with the spirit of the age. All over the country our large cities are made attractive, and we must do something of the same kind if we would hope to compete with our neighbors. There was a time when Philadelphia stood preëminent as the first city in the Union, and her people recognized as the most refined of any in the country. Here is an opportunity for the city to secure for herself a prominence above all her neighbors. The erection of magnificent buildings on these squares, and upon the finest street in the world, will attract attention to them, and they will be recognized as the homes of science and art."

We have already stated that favorable action has been taken in Brooklyn, N. Y., for the appropriation of one of the finest squares in that city for a similar purpose. Will San Francisco be behind her sister cities in a matter of this kind? We trust not. Petitions to the Board of Supervisors are being freely signed, asking for favorable action in the matter, in that body.

ASSAY AND CHEMICAL DEPARTMENT OF THE COLLEGE OF CALIFORNIA.—We would call especial attention to the advertisement, in another column, of the chemical and assaying department of the College of California. The laboratory connected with that institution has recently been carefully refitted, under the special charge of Prof. W. B. Rising. Particular attention will hereafter be given to instruction in assaying in all its branches, as well as to qualitative and quantitative analysis.

The Weather and the Rainfall.

Last fall's predictions of the weather-wise for the season thus far advanced, have been most sadly at fault. Instead of the light rains and open weather, prophesied as an offset for the extreme wet weather last year, more rain has fallen the present winter, thus far, than fell up to the same time last winter. For the purpose of ready comparison, we give the record of last year as compared with this up to the present time:

1866-7.		1867-8.	
September.....	.04	September.....	.04
October.....	.01	October.....	.21
November.....	.24	November.....	.84
December.....	15.16	December.....	10.69
January.....	5.16	January.....	9.50
February.....	22.74		23.84
March.....	1.58		
April.....	2.36		

Total for last winter 33.88

The rainfall of the present winter, thus far, at Nevada, according to the record kept at the Yuba Canal Co's office, has been 72.13 inches—over six feet, or three times as much as has fallen in this city, according to Mr. Tennyson's record. This disproportion between the rainfall at San Francisco and the mountains, is so much greater than usual as to almost lead one to think that there must be some mistake in the record. The rainfall of the present year has been unusually continuous from the first setting in of the rain until the first of the present week. Last year, an unusual quantity fell in December, and but a comparatively small amount in January. This year, the quantity for the two months has been nearly equal, and unusually large. The consequence has been the rivers and cañons have had a constant excess of water, which, with the constant fall of rain or snow, has more than usually interfered with the labors of the miner, and kept the roads in such an utterly impassable condition that traveling and transportation have been almost entirely suspended, except by water and railroads.

But if anything can be predicted on present appearances, we are now entering, though rather late, upon the usual pleasant season between the early and the latter rains. The possibilities of a pleasant February, which have been ushered in with such unusually charming weather, are rendered more than probable by the unusual amount of rain which has already fallen.

FEUCHTWANGER'S POPULAR TREATISE ON GEMS.—The third edition of this work, materially enlarged, was issued last summer, the second edition having been exhausted without satisfying the demand. The book embraces over 500 pages, and affords more interesting reading for the general reader, than would naturally be inferred from the title of a special treatise. The author appears to us, from a personal interview, to be a man of much scientific attainment, engaged in the practical avocations of life; a gentleman who has foreseen the want of such a work, and rendered a large amount of valuable information in a popular and practical form. It is embellished with numerous plain and colored plates, illustrating the form and color of minerals and gems to such a degree of minuteness as can only be reached by much care and expense. The truthfulness to nature of these illustrations, alone enhance its value to the ordinary reader. Tables for reference are introduced, prominent among which we observe that termed "The Distinguishing Characteristics of Gems." The book will especially interest prospectors, students, lapidaries, jewelers, mineralogists, metallurgists, and ornamental architects. We shall place it in our advertised list for sale. The Doctor's likeness on the frontispiece will be recognized by friends on the Pacific coast, as a good representation of his animated and genial countenance.

A NEW COUNTY.—A movement is on foot by parties interested, to establish a new county "high up" in the mountains, and christen it with the significant name of Alta. The territory embraced in the proposed new county is to be taken from the upper portions of El Dorado, Placer and Nevada counties. Truckee City has been selected for the county seat.

L. L. LANCASTER, of Vancouver, has invented a hand shingle-splitter that will cut 36,000 in ten hours.—*Ec.*

We invented a shingle machine a year ago, and employed DEWEY & Co., of the MINING AND SCIENTIFIC PRESS, to solicit a patent for us. A Year has elapsed, and no word as yet from our application. What is the matter, friend Dewey?—*Heldsburg Standard.*

Since our neighbor of the *Standard* has, by the above publication, made public the delay attendant upon his application for a patent, and his call for information, we will follow suit and convey the information sought through a similarly public channel. Your application was filed with us Feb. 2d, 1867. Your model was a very rough and hastily constructed one, which we at the time objected to sending to the Patent Office; but at your particular request finally did so. As we expected, after some considerable delay the model was refused, and DEWEY & Co. were informed of the fact by mail. We then directed our agent at Washington to have the model properly constructed or amended, and the application renewed, which was promptly done. At last advice your application was on file at the Patent Office, and awaiting its turn for examination. Our agent there has general instructions to look diligently after all applications through us, and see that there is no unnecessary delay. We presume there has been no delay in your case, which it was in the power of any agency to remove. As soon as the case is decided (which decision we are daily expecting), you will be promptly notified of the result by mail. Perhaps we should add, that much of the delay experienced by all inventors during the past year, has been the fault of the Patent Office, the nature of which has already been fully explained in our columns. The cause of such delay has now, however, been remedied, and inventors may hereafter expect more prompt attention.

DISINFECTION BY STEAM.—The novel attempt was recently made by Commander Chandler, of the U. S. Steamer *Don*, to disinfect that vessel from impregnation with yellow fever, which had broken out on board with great violence. He put into the port of Vera Cruz, where the sick were landed, and preparations for disinfection made by battening down and closely securing the berth-deck and ward-rooms. Hot steam was then turned into them until the thermometer, which was introduced through a small opening, indicated about 200 degrees of temperature. The hatches were then opened, decks dried down, and in two hours more there was no indication of the extreme heat to which those places had been exposed. No cases of fever occurred afterward. There had been twenty-three cases on board and seven men died. Commander Chandler informs the Department that he is fully persuaded that heat eradicated the disease as well as a severe frost could have done. The experiment is a most important one, as it can be resorted to in any climate, or even at sea.

[Communicated.]

EDITORS OF MINING AND SCIENTIFIC PRESS:—I see, by your issue of Jan. 11th., that the writer of a series of articles, upon the formation and distribution of igneous rocks, is disposed to take exceptions to some of my criticisms. I wish no controversy with that gentleman, and am glad to see that, though he remonstrates, he exhibits no ill feeling in doing so. I must still express my regrets however, that if he has spent so much time, as his note indicates, in the study of chemistry, geology and the allied sciences, that he has apparently done it to so little purpose. I understand his challenge perfectly; but my criticisms were not written for the sake of provoking an argument; and I have neither time nor disposition to devote to a discussion that might be endless. *Criticus.*

At last accounts there was about twenty feet of snow at Meadow Lake.

KUSTEL'S NEW BOOK.—The *Evening Bulletin* of this city, in prefacing some quite lengthy extracts from Mr. Kustel's new book, speaks of the work as follows:

"Dewey & Co., publishers of the MINING AND SCIENTIFIC PRESS of this city, have just published a book written by Guido Kustel, mining engineer and metallurgist, the scope of which is best expressed by its somewhat lengthy title—'A Treatise on Concentration of all kinds of Ores; including the Chlorination Process for Gold bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally.' Besides the text, there are seven plates and one hundred and twenty diagrams, which illustrate nearly all the improved machinery and processes now employed in gold and silver mining. This is, probably, the most elaborate work on practical mining which has ever been written and published in this country. And that such a treatise should have originated in California is a matter for special congratulation, since its object is to illustrate and develop what has heretofore been the great leading interest of the Pacific slope. Our people have lost millions of money by unskillful mining, and we shall continue to lose millions more every year, until we are content to patiently learn the best methods of extracting the precious metals. Experience will go a great ways; the only evil is that it sometimes cost so much that parties are ruined by it. But when all the helps of science have been obtained, there will still be a broad margin for experiments, many of which will be made with greater certainty of success than now. And when there shall have been a more complete union of mining as a theoretical science, with practical experiments, we may look for the best school of miners in the world. The difficulties presented by 'rebellious' ores are so great, and the prospects which complete success will ensure, are so magnificent that we may expect scientific mining in this country to be carried to the utmost degree of perfection. The book before us is one of the indices of the better times to come. Mining is no longer to be a haphazard business, and the tailings which go down stream will not be worth more than the bars extracted from the same rock. A book so thorough and elaborate ought to be in the hands of every practical miner, even if some precious theories are overturned thereby."

LLOYD'S PATENT ANCHOR.—The Pacific Rolling Mill Company will soon commence the manufacture of Lloyd's new patent anchor. This is a California invention, patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, and which is universally admitted by competent judges to possess decided merit over any other anchor. A radical improvement upon the old anchor was made by Trotman, who adjusted a movable fluke so that however the stock might be turned, one fluke would always hold on the ground. In Lloyd's invention the fluke does not move laterally, or at angles with the shank, but both flukes roll over at the same time, so that the anchor cannot be so adjusted that both flukes do not hold at once, thus apparently doubling the holding capacity of the anchor. It is eminently proper that the manufacture of this article should commence where the invention was first brought out. We trust that it may yet form no inconsiderable item in the business of the Pacific Rolling Mills.

A NEW MINISTER TO CHINA.—The appointment and prompt confirmation of J. Ross Browne as Minister to China, *vice* Burlingame, is somewhat unexpected, but far from being unwelcome to the people of the Pacific Coast. Mr. Browne is well known on this coast, and is tolerably well informed with regard to our resources and wants. As it is eminently proper that the China mission should be filled by a resident of the Pacific Coast, we do not know that the Government could have made a better selection. True, Mr. B. is as yet untried in the difficult and devious ways of diplomacy; but he is a man of large cosmopolitan experience, and is probably quite as well acquainted with the needs and nature of our commercial intercourse with the East as any other available man. So far as industry and devotion to the legitimate purpose of his mission will avail, Mr. Browne will leave nothing undone to render himself useful and efficient in building up our growing commerce with the Orient, and in strengthening the feeling of cordiality and confidence which it is so necessary to maintain with the government of China. We trust that Mr. Browne's fondness for traveling will not induce him to turn aside from his legitimate field of labor to follow in the footsteps of his predecessor in seeking for the position of Roving Ambassador for his Celestial Majesty.

HOFFMAN'S WINDOW BLIND AND ANTIDUSTER, for keeping out dust, smoke, etc., from cars and dwellings, has been placed on one of the San José cars for trial. This is a San Francisco invention, patented through the MINING AND SCIENTIFIC PRESS AGENCY. It is said to be especially adapted for railway cars, etc. The window patented is lined on the inside with gutta percha. The slats are of glass; their outer sides being concave, and are fixed on the gutta percha, lapping over each other. Gutta percha tubes are fastened to the window at the top and bottom, and a small stream of water, supplied from a tank on the roof of the carriage, passes through them, moistening the slats. The current of air forced in by the motion of the car, is purified by passing between the moistened slats, and enters the lungs of the passengers pure from all dust, smoke, or other impurities. The inventor has introduced his patent at the East with considerable success, and after experimenting on it here proposes to make arrangements for the manufacture of the new window in the Atlantic States. Application is also about to be made, through this agency, for securing patents in all the principal European countries.

MARKET STREET HOMESTRAK ASSOCIATION.—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 2v15-3m

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required.

Avery's Great National Pump and Well.

This Well is formed by driving metallic tubes into the ground until water is reached. The valves are then dropped down the pipe, then the pipe is raised six inches to allow free ingress of water. The Pump is now ready to work. For the first thirty minutes we draw up earth, etc., till a vacuum is formed, which makes the Well. This Pump has proved itself to be the greatest invention of the age. It will raise water 500 feet. State, County and Town Rights for sale. Pumps furnished at moderate prices, by **S. P. ROBERTS,** Agent for California and Nevada. 318 Pine street, San Francisco. 5v15-3t

Oakland College School.

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps, all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rack and Drop Presses, Coining Machinery, File Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Boldin's pan, Veatch's tubs, Frater's concentrators, Wakley's pans, Beer's pan, German Barrels, Astra Gear, Chile Mills. Settlers of all descriptions, Rectorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

ELECTROTYPING, ENGRAVING, ETC.—Our Job Printing

Office is abundantly supplied with elegant engravings, or

namens, and other embellishments to suit the various

branches of industry in this State.

A CANAL ON FIRE.—In an investigation as to the condition of the rivers Ayre and Calder, which water the great towns of Yorkshire, it was found that the fluid of Bradford Beck, the source of supply to the Bradford canal, was so corrupt from sewerage, that in summer large volumes of inflammable gases were given off; and although it has usually been considered an impossible feat to "set the river Thames on fire," the boys found it practicable to set the canal on fire, the flames rising six feet high, and running along the surface of the water for many yards, enveloping the canal boats, to the great terror of their passengers. That this state of things is not limited to one district was abundantly proved by inquiries at other towns.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letters, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.

Hamburg, by Hamburg mail—2 cents each.

Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.

Lunenburg, by Bremen mail—3 cents each.

Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

3½ cents per 1½ ounce.

Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—4 cents each.

Italy, by Bremen or Hamburg—5 cents each.

Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mails via Trieste—3 cents each, and 2 cents per 1½ ounce.

PHARMACEUTICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.

Hamburg, by Hamburg mail—1 cent per ounce.

Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.

Lunenburg, by Bremen mail—1½ cent per ounce.

Lunenburg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Sweden, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.

Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1 cent per 1½ ounce.

Italy, by Bremen or Hamburg—1½ cent per ounce, and 2 cents per 1½ ounce.

Turkey, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—1½ cent per ounce, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—1½ cent per ounce, and 2½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail via Marseilles—1½ cent per ounce, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—1½ cent per ounce, and 2 cents per 1½ ounce.

These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

D. & W. FOURNESS, Prop'rs.

WHY ARTIFICIAL TEETH SHOULD NOT BE WORN AT NIGHT.—It is a physiological fact that bone, in a normal condition, is constantly undergoing a process of renewal and replacement of particles, and that continuous pressure prevents the complete restoration of the parts, causing what is commonly called absorption. The osseous structure of the mouth is protected only by a thin covering of muscular tissue and mucous membrane, on the firmness and elasticity of which it depends for protection against the pressure of the plate; but when constantly excluded from the atmosphere, especially by hard rubber, which being a poor conductor of heat, keeps the part covered at nearly an equal temperature, these tissues lose their elasticity and become spongy and fungoid. Two very undesirable results are arrived at. The osseous structure of the mouth, as well as its fleshy covering, are changed in form, and the plate no longer fits well, which is just what the patient has been trying to avoid by wearing his plate at night.

EFFECT OF ELECTRICITY ON SEEDS.—M. Blondeau asserts that, after many experiments, he has found the action of an induction current on seeds, before planting, produces very beneficial results, noticeable in their subsequent growth. In experimenting with beans, peas, and cereal grains, the seeds were soaked in water for some time, and were then submitted to the action of a current for several minutes. After this they were planted in pots filled with good garden earth, and at the same time other non-electrified seeds were planted and kept under the same conditions for the purpose of comparison. The former always came up first, grew more rapidly, and gave much more vigorous and fruitful plants than the latter. "But," says M. Blondeau, "one very singular fact is that many of the electrified seeds obstinately persisted in growing with the true root pointing up in the air, while the plumule was directed downward," which gives a little shade of incredulity to the whole statement, but the experiment is an easy one for any interested person to try for his own satisfaction.

WHITE PASTE.—The *London Photographic News* states that a good white paste, pure in color and adhesive to all surfaces, may be made as follows: A solution of 2½ ounces of gum arabic in two quarts of warm water is thickened to a paste with wheat flour; to this is added a solution of alum and sugar of lead, 720 grains in each water; the mixture is heated and stirred about to boil, and is then cooled. It may be thinned, if necessary, with the gum solution.

THE GOLDEN ERA.

Founded in 1852, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Normalizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

PACIFIC RAILROAD BONDS A DESIRABLE INVESTMENT.—The Call, of this city, in alluding to the desirableness of seeking outside investment for the rapidly increasing surplus capital of this city, very correctly speaks of the desirableness of the Pacific Railroad bonds, for such investment, as follows:

In examining the opportunities for profitable investment which the interior offers, and which San Francisco would do well to patronize, the bonds of the Central Pacific Railroad Company—our half of the great continental road—occupy a high place. These bonds differ entirely from stock of any kind. The profits on shares of stock in any enterprise are dependent upon the receipts, and are high or low according to the earnings of the enterprise. There is no obligatory clause which compels a dividend to be paid to a stockholder. But with these bonds it is entirely different. They have thirty years to run, and they are sold at ninety-five per cent. of their par value in greenbacks; or, in other words, at the present price of greenbacks (seventy-two cents) \$684 in gold will buy a \$1,000 bond which yields a net income of six per cent. per annum in gold on its face value, or nine per cent. per annum net in gold on the sum paid for the bond. The payment of this rate of interest upon these bonds is made obligatory, and has, for a fund to draw from, all the immense receipts of the road from every source. The bonds constitute a first lien upon the road—its franchise, all its receipts, rolling stock, lands, buildings—in fact, upon everything owned by the company. The amount of bonds issued by the company is limited by law to less than one-third the cost and value of the road and its equipments, that are pledged for their redemption when the term for which they are to run (thirty years) shall have expired. The rate of profits named is within one per cent. of the rate lately paid by loan societies to depositors; the security offered by the bonds is a much safer one than loan societies hold, and the dividend they yield is unchangeable. All the signs here point to a still further reduction of the rate of interest. paid by loan societies—six or eight per cent. per annum promises to become the rule. Investment in these railroad bonds is one that is attended with no fluctuation, with no anxiety, and demands no attention. All that the holder has to do is to present his bonds at stated intervals and receive his dividend in gold coin. In proportion to the amount of bonds taken here, the earnings of the road will be retained in the State, and thus go to enrich it. If the bonds are all taken abroad, the earnings of the road will be drained from the country, and thus, to a certain extent, impoverish the State.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 345 Clay Street, San Francisco, Jan. 1, 1868.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains statistics and descriptions of all new mining processes, and all machines invented to facilitate the extraction of the precious metal from ore and rock with which it is bedded. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments. *—Iron Age Union.*

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three months' delay requisite in transacting business through Eastern agencies.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as many one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA, San Francisco, May 24, 1866. Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval. They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks. We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable. As a California investigation of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it. WM. H. TILLINGHAST, Sub-Manager.

We do hereby certify that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied severely to Vauls and Safes, to entire satisfaction to parties interested. KITTREDGE & LEAVITT, Pioneer Iron Works, cor. Fremont and Market sts. SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vauls in every other respect as good as any other improved combination lock which I am acquainted with. JOHN R. SIMS, Vault Manufacturer, Oregon street, JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons: 1st.—Because it is impossible for either burglar or expert to pick it. 2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder. 3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of lock making. R. COSNER.

Attested by J. C. SHIPMAN, County Clerk. JACKSON, April 27, 1867. The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe very few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and deem this lock to be all that the inventor claims for it. OTTO WALLHEER.

Attested by J. C. SHIPMAN, County Clerk. CALIFORNIA LOCK ADWARD.—A special premium was awarded Mr. W. C. Bussey for his superior Combination Powder and Burglar Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the lock at that time, have been fully confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates. [Mining and Scientific Press, Sept. 29, 1866.]

They are the only safe lock ever invented. Every State and County treasury vault, and every bank and business place should have one. [Amador Ledger.]

This is a lock in which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair. [Sacramento Union.]

Wo, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed. F. MARST & C. FLETCHER, No. 18 Post street.

REFERENCES: R. COSNER, Sheriff. O. WALTHER, Treasurer. W. JENNINGS. O. H. INGALLS, Supervisors. L. McLAINE.

Any good blacksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be. [See page 39 in Pacific Coast Directory.]

A deaf or blind man can open this lock, when he knows the set and understands the full manipulation, without any expert detecting the combination. 19v14m11-18.1am

Hope Gravel Mining Company.—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of January, 1868, an assessment (No. 20) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to David Wilder, Secretary, at the office of the Company, No. 333 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventeenth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.

Office, No. 333 Kearny street, corner of Sacramento, San Francisco, California. Office hours from 12 to 2 P. M. feb

La Blanca Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the second day of January, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Alfonso...	1	1	\$2.50
C. B. Richard & Sons...	522	1	120.00
Benjamin Fishel...	354	1	2.50

MOSHEIMER'S Pioneer Mining School.

Office, 328 Montgomery Street,

SAN FRANCISCO.

MOSHEIMER'S

NEW ROASTING FURNACE.

Patent applied for.

This Furnace has proven the most successful of any ever built on this Coast. A great number are in use now, and many in course of construction. Their superiority over all other furnaces, is as follows:

1.—The cost of building is only \$300 for a one ton Furnace.

2.—They require less than half a cord of wood per ton of ore.

3.—The ore is roasted to a spongy condition; while in a common reverberatory it takes into globules.

4.—It is a saving of 50 per cent. of labor over any Furnace in use.

A full size working Furnace can be seen at my Metallurgical Works in this city, by applying at my office.

JOS. MOSHEIMER,

328 Montgomery street, San Francisco.

A Sulphuret Mine Wanted.

Any party having for sale a Mine, with Gold-Bearing Sulphurets, of not less than 15 per cent., and which pay at least \$10 per ton, can find a purchaser by addressing, in writing, particulars to

JOS. MOSHEIMER,
56 1/2-Sun
San Francisco.

New Mining Advertisements.

Arizona Consolidated Mining Company, Encina District, Arizona Territory.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-third day of December, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Z. B. Heywood...	170, 219, 226, 245	38 3/4	\$193.75
W. R. Heywood...	201, 223, 257, 270	10	50.00

Office, 315 California street, up stairs, San Francisco. jan25

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be handed in as early as possible.

Rippon Gold and Silver Mining Company.—Location of Works: Silver Mountain Mining District, Alpine County, State of California.

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and so the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp into contact with perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY,** San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

Pacific Iron Works.

San Francisco, Aug. 29, 1867.

BLAKE'S QUARTZ BREAKER!
PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

-BY-

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
3v15f SAN FRANCISCO.DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and prices, address

D. J. B. BEERS, San Francisco.

Per Wells, Fargo & Co's Express.

NOTICE TO MERCHANTS
—AND—
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working; no goods require no sinking or landing; consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any tastering or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

MORGAN HUNGERFORD.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz, or other Rocks, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600

No. 2—Or 12-inch Crusher, capable of similarly putting through five to six tons per hour..... 850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wooden frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, P, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.

JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON,

Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. For particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than twelve months. All persons desirous of procuring the same, without having recourse to legal proceedings, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

JAMES BRODIE, Fulton Foundry, or CHARLES RADCLIFFE, Express Building, 402 Montgomery street, San Francisco.

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, proreared, some time since, a release of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages.

Several infringing machines are made and offered for in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

PATTINSON'S
HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

THOMAS PATTINSON

STEWART'S
CELEBRATED HINGED
Grinder and Amalgamator.

The Cheapest and Quickest Pan now used.

It is flat bottomed, loses far less power in throwing the pulp, and circulates the same under the muller to better advantage than any other Pan in use, while the steam-owing to the thinness of the cone, has a more direct effect of heating the pulp. E is the muller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle in the same—the bottom wearing down even with the dies. Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

ENLARGEMENT
OF THE

American Journal of Mining

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages.

Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, milling and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, WESTERN & COMPANY, Publishers, 37 Park Row, N. Y.

MINING IN INYO COUNTY.—We clip the following extract from a letter written to the Territorial Enterprise by Dr. James Delevan, from Cerro Gordo Mining District, Inyo County, under date of Dec. 20th: The Inyo chain of mountains contains a great amount of mineral for a distance of 100 miles, as also the Sierra Nevada mountains on the west side of Owens Valley, at intervals, for a long distance. For several years back there have been numerous attempts at mining in this region, but for want of proper management, the parties undertaking these enterprises have met with little success. However, the time is not far distant when this will be the most busy mining region in the known world. The mines vary in kind and character in different localities. Some are gold mines, some mostly silver and copper, and others lead. On the east side of the Inyo mountains is a large saline valley, the salt from which will be of immense value for the working of the silver ores of the adjacent mining districts. Mexican miners are taking out considerable gold at the Coso mines, and there are reports that some of them have discovered very rich placer mines, said to be some 50 miles below there. It is reported here that as high as \$100 to the pan has been obtained in these newly discovered diggings. But the Indians are very hostile, and drove the men out of the country who found the diggings. Some of the men at Lone Pine are about to go down there prepared to work the placers, notwithstanding Indians. Many Mexicans have left the Cerro Gordo mines to go to these new Coso mines. In Cerro Gordo district not much mining will be done this winter. Now is the best time for purchasing interests in the mines, as holders of claims, as a general rule, have little or no money, and no purchasers have yet visited the district.

PLUMAS COUNTY MINES.—We condense the following from the Spanish Ranch correspondent of the Quincy Union of January 11th: Ditches and flumes have suffered, likewise dams and hydraulic pipes by snow-slides, land-slides and little avalanches. Several of Jacks Co's flumes have been prostrated and their ditches broken in several places. The new ditch of Mr. Metcalf has suffered badly. Jenkins & Co., have only been compelled to lay over but two days, and have struck in their tunnel some very rich dirt. John Colman, on the Blue Lead, has some excellent prospects on the head of Quien Sahe Ravine. O'Brian & Garrett have bought out Newt. Evans, at New Boston, and are fixing up their claims for winter drifting. The miners in Silver Creek District are doing well. Sanders & Co., on Grub Flat Ravine, are doing tolerably well. Hamp Brown & Bro., Morris Smith & Bro., and all the balance of the boys on and around Badger Hill, Gopher Hill, Curtis' Point, etc., are doing remarkably well. John Ball, of Butterfly Valley, has got into his new diggings, and is getting good pay, considering short days and high water. J. Rogers is likewise doing well in Michigan Ravine. Tommy Taylor and John Radley are making money on Bradley's Point, near Grasshopper Valley.

HOW MUSKRATS SWIM UNDER THE ICE.—Muskrats have a curious method of traveling long distances under the ice. In their winter excursions to their feeding grounds, which are frequently at great distances from their abodes, they take in breath at the start, and stay under the water as long as they can. They then rise to the ice and breathe out the air in their lungs, which remains in bubbles against the lower surface of the ice. They wait till this air recovers oxygen from the water and ice, and then take it again, and go till the operation has to be repeated. In this way they can travel almost any distance and live any length of time under the ice. The hunter sometimes takes advantage of this habit of the muskrat in the following manner: When the marshes and ponds where the muskrats abound are first frozen over, and the ice is thin and clear, on striking into their houses with his hatchet for the purpose of setting their traps, he frequently sees a whole family plunge into the water and swim away under the ice. Following one of them for some distance, he sees him come up to renew his breath in the manner above described. After the animal has breathed against the ice, and before he has time to take his hubble in again, the hunter strikes with his hatchet directly over him, and drives him away from his breath. In this case he drowns in swimming a few rods, and the hunter, cutting a hole in the ice, takes him out. Mink, otter and beaver travel under the ice in the same way, and hunters have frequently told me of taking otter in the manner I have described when these animals visit the houses of the muskrat for prey.

TO CUT GLASS.—Broken glass may be utilized, and broken bottles be turned to useful jars, by a simple means of cutting glass, which consists in first scratching it with a diamond or file on the curved or straight line to be cut, and then tracing the line with an ignited pencil, made as follows: One-eighth of an ounce of gum tragacanth, dissolved in sufficient water to form a thick paste, is mixed with a solution of one-fourth of an ounce of powdered gum benzoin, in the least possible quantity of strong alcohol; to the mixture is added enough powdered beechwood charcoal, to form a doughy mass; this is rolled into little pencils, about four inches long, and left to dry. Such a pencil will, on being ignited, burn to a fine point until it is entirely consumed. As contact with the glass tends to check combustion, it is essential to withdraw the ignited pencil every few seconds, and hasten its burning by brisk blowing.

SAW MADE OF BONE.—The Maoris or natives of New Zealand are a race far in advance of most of those found in the Polynesian Islands. In working wood and bone they evince no little skill; their carvings being very elaborate and tasteful. In making instruments for various uses, they rise far above the aborigines of any part of the American continent. A saw, for instance, was an article unknown among the aborigines of America, yet such an instrument was made of bone by the natives of New Zealand. It was those Maoris who withstood the English troops so long and so valiantly in the late "New Zealand war."

A PECULIAR COAL.—In Brazil, Clay Co., Indiana, there is found a species of coal which in appearance and gravity resembles charcoal, having even the woody fiber of the latter. So valuable is it for smelting purposes that one furnace in St. Louis is using five car loads a day, and its existence needs only to be known to increase the demand from other establishments indefinitely. In the same neighborhood is also found an abundance of native iron ore of a superior quality, and a number of ironmen from Ohio and Pennsylvania have lately been investing heavily in real estate, and the erection of mills and furnaces in this section.

PHOTOGRAPHING CHILDREN.—Mr. H. J. Fellows gives in the *Philadelphia Photographer* a simple and effective remedy for the difficulty of obtaining sufficient time upon children's pictures. He heats the developer. To do this he turns up the edge of a quarter metal plate so that it will hold just sufficient for one development, and then heats it over a gas flame. By this means he has frequently obtained a picture in ten seconds. It may perhaps lack softness and depth, but what can one expect from a child who will not sit still.

SIXTH INDUSTRIAL EXHIBITION UNDER THE AUSPICES OF THE MECHANICS' INSTITUTE, SAN FRANCISCO.

The undersigned, acting under authority from the Mechanics' Institute of the City of San Francisco, take great pleasure in announcing to the public that they have resolved upon holding an Industrial Exhibition in the month of August, 1893, on a much larger scale than was ever before attempted on this coast; and they make this early announcement of their intention, that all who may desire to participate shall have ample time for preparation.

A programme, embracing rules and regulations for the government of participants, with a list of Premiums to be awarded, etc., is receiving such earnest and careful attention as the importance of the enterprise demands and in due season the same will be made public by circulars widely distributed, and by advertisements in the leading journals of this coast.

Executive Committee:

OEO. K. GLUYAS, P. J. O'CONNOR,
THOMAS YOUNG, EDWARD NUNAN,
D. E. HAYES, OARDNER ELLIOTT,
HORACE D. DUNN, H. F. WILLIAMS,
GEO. T. BOEHN, C. M. PLUM,
H. ROSEKRAUS, J. A. HUTCHARD,
C. H. HARRISON, W. J. LEWIS,
D. R. COLEMAN, W. W. DANSON,
W. C. PEASE, JOSEPH MOSHEIMER,
C. L. SPIERS, WILLIAM GORCORAN,
C. L. TILDEN, A. D. MACDONALD,
IRVING M. SCOTT, GEORGE COFFMAN.

To Mine Owners.

THE SUBSCRIBER, HAVING HAD MANY YEARS EXPERIENCE IN MINING AND DOING BUSINESS CONNECTED WITH MINING OPERATIONS, OFFERS HIS SERVICES TO PARTIES WISHING TO PURCHASE MINES, TO EXAMINE AND REPORT UPON THE SAME, TO BUY, REPORT UPON THE FILES OF ANY MINE OFFERED FOR SALE, AND TO TRANSACT ANY BUSINESS CONNECTED WITH MINING OPERATIONS IN THIS DISTRICT. Also, he would take the Superintendency of the affairs of a Mining Company. Refer to proprietors of Mining and Scientific Press. Address,
Lone Pine, Inyo Co., Cal.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:
On Orders not exceeding \$25 10 cents.
Over \$25 and not exceeding \$50 25 cents.
No fractions of cents to be introduced in an order.
United States Treasury Notes, or National Bank Notes only received or paid.
To send over \$50, additional Orders must be obtained.
Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out:
No. Amount Date,, 1893

MONEY ORDER.

Required for the sum of \$.... Payable at
State of Payable to Residing at
State of Sent by
Residing at State of

ENTERED IN REGISTER: Postmaster.
Names of parties and places, and the sums, to be written in the plainest possible manner.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean, and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

Acids Chemically Pure,
Nitrate of Silver,
Cyanide of Potassium,
AND CHEMICALS OF ALL KINDS.**

Manufactured by the PACIFIC CHEMICAL WORKS,

FALKENAU & HANKS,

Laboratory, Sixteenth street, near Folsom. Office, 619
Montgomery street, San Francisco. 2v15f

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done.

8v13-17 Stove Store, No. 125 Clay street, below Davis.
M. PRAG.

To Quartz Miners.

Two Quartz Mills for Sale at very Low Rates.
PARTIES WISHING TO PURCHASE WILL SAVE 50 per cent by calling at HOWLAND'S SAMPLE MILLS, No. 24 California street, San Francisco. 2v15-3m

HAYWARD & COLEMAN,

IMPORTERS AND REFINERS

—OF—

Illuminating, Lubricating,

—AND—

PAINT OILS!

CONSISTING OF

KEROSENE, LARD, SPEARM, ELEPHANT, POLAR, TANNERS', NEATSFOOT, BOILED AND RAW LINSEED, CASTOR AND CHINA NUT.

—ALSO,—

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of MILL OWNERS and ENGINEERS to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 19v13-3m 414 Front street, San Francisco.

WE ARE NOW OFFERING OUR IMMENSE STOCK

—OF—

Fine Custom Made Clothing

—AND—

Gents' Furnishing Goods

AT PRICES THAT DEFY COMPETITION.

Our Stock of Clothing Consists of

THE TIN MINES OF MISSOURI AND CALIFORNIA.—Col. Morrill, U. S. A., recently paid a visit to the newly discovered tin mines of Missouri, when he gathered up about forty pounds of the average ore, and subsequently assayed it. The result of three of these assays is minutely given. No. 1, gave 1.55 per cent. of tin; No. 2, 2.41 per cent.; No. 3, 2.62 per cent.—or an average of 2.19 per cent. This must be considered a very low average yield, if much expense is incurred in mining the ore, with regard to which no data are given in Col. Morrill's report, which, by the way was made to Lieut. Gen. Sherman, as his commanding officer. An average yield of 2.19 per cent. would give but about \$11, for the product of 2,000 pounds of ore (43.80 lbs. of tin), delivered in New York city. The Temescal mines, in the mountains to the east of Los Angeles, will yield from three to five times that percentage. The latter mines will be actively, and no doubt profitably worked, as soon as the title to the same is fully settled. Such a settlement, we understand, has already been or soon will be effected.

Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

By Mail.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

A. T. DEWEY. C. W. M. SMITH. W. B. EWER.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (4 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. Its files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS,

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its FORTY-THIRD VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1886:

RESOLVED, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free.

July 1st, 1887.

DEWEY & CO.,

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thank for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness:

GEORGETOWN, January 22, '87.
Messrs. Dewey & Co.—Sir: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Letters Patent" on my application through you for an "Improved Machine for Washing Ores." It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf. Very truly yours,
M. A. WOODSIDE.

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

Mineral Land Law Blanks
FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

- I. Applicants' Declaratory Statement.
- II. Diagram, Description of Diagram and Boundaries, and Notice.
- III. Register's Order for Publication—with Notice.
- IV. Deposition that Notice has been Posted.
- V. Application for Survey Etc.

PRICES.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Changing the Address.—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. ... at ... P. O., ... County, ... State, to Mr. ... at ... P. O., ... County, ... State. 188-"

Mining and Scientific Press.

Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

TABLE OF CONTENTS.

Portable Fire Extinguisher.—Illustrated. Retaining and Lacing. The Mining Academies of Saxony and Hungary. A Good Deal "Less than no Time." Forests and Rain. Central Pacific Railroad. The Freiberg Barrel Process for the Reduction of Gold and Silver Ores—No. 11. Salt Spring Valley and the Adjacent Region in Calaveras County. A Steam Man—Extraordinary Invention. Utilization of Woolen Rags. Petroleum Exports. New Steam Engine. **MECHANICAL MISCELLANY.**—Transferring Power: Paraffine as a Lubricator for Heated Machinery; Artificial Grindstones; Making Hinges.

VETO OF THE YOSEMITE BILL.—Governor Haight has been fortunate in his first subject for the exercise of the veto power. He has suited everybody except the unfortunate squatters who lose their land. While all sympathize with these settlers, all at the same time admit that such mere occupation of public lands does not, and should not, deprive the government of the right to dispose of them for the public benefit. It did so dispose of this Valley, by a grant to the State of California, upon the express conditions that it should be held for public use, and should be inalienable for all time. The State accepted the grant upon these conditions; and having so accepted it, she is bound to comply with them. As the Governor suggests, whatever rights the settlers might have had, can be satisfied by paying for such improvements as they had at the date of the Act of Congress making the grant, or by a lease at a nominal rent for a term of years. Leases not exceeding ten years may be granted for portions of the premises, such being allowed by the terms of the Act.

NEW STEAM ENGINE.—A steam engine of quite a novel construction is now in operation at the brass foundry of Messrs. Weed & Gallagher, on Fremont street, in this city, which is well deserving the attention of mechanics and engineers. The mode of construction and appearance of this engine is quite as much of an innovation on any plan heretofore employed as the Hick's engine, and it is equally as compact and simple. The entire engine, which is oscillating in its construction, consists of but five parts. No packing whatever is required. We are assured by the builder that its cost will be only about one-third that of a stationary engine of the same capacity, while the amount of machine work about it is not over one-fifth. It can be used as a steam engine, a hydrostatic engine, an air or force pump, and as a water meter. The inventor is Mr. H. B. Martin, a well known and skillful mechanic of this city, who is also the patentee. We shall endeavor to give a more extended and probably an illustrated description of this novel piece of mechanism at an early day.

DR. SWARTZ recommends the use of magnesite, a natural carbonate of magnesia, for obtaining the carbonic acid required in soda water.

Portable Fire Extinguisher.

The dangers of fire breaking out, especially at night, are always greatly increased by the confusion usually consequent upon the lack of instant preparation to meet that emergency; and what might easily have been overcome in a few minutes, by a little prudent foresight and preparation, often becomes a dangerous and destructive conflagration. Complete readiness, and the utmost celerity and promptness, are the requisites for such an emergency. "The Portable Fire Extinguisher" just meets the exigencies of the case. It is simple, inexpensive, *always ready*, prompt, and will do more execution than twenty or thirty times the amount of water which can be placed in the same space. As we presume but few of our readers have ever seen even the outside of one of these machines, and a still less number have made themselves acquainted with its interior construction and manner of operation, we have appended hereto an illustrated description of the same.

Fig. 1 shows the extinguisher ready for use.

Fig. 2 shows a sectional view of the extinguisher, which will be quite well understood by reference to the following directions, to be observed in preparing it for use:

The space *a* is filled with water, the tube *b* is filled with the contents of canister *f*, and the contents of canister *g* is put into the water *a*. By applying the wrench *h* on the screw *c*, it forces down the rod *c* upon the plug *d*, the contents of the tube *b* fall into the extinguisher, and the two compounds come together and form the extinguishing liquid, which being a non-supporter of combustion, is of a much more

powerful nature than twenty times its equivalent of water. Thus, a No. 2 Extinguisher contains eight gallons of liquid, equal to 160 gallons of a more efficacious material for extinguishing fires than water alone, which will project itself with its own power to a distance of forty feet, by the mere turning of the tap, which puts it in full and complete action.

The contents of canister *f*, which are placed in the tube *b*, consist of bi-carbonate of soda. The contents of canister *g*, which are dissolved in the water contained in the space *a*, consist of tartaric acid. When the carbonate of soda is dropped into the water by the above appliances, a large amount of carbonic acid gas is developed, which, by turning the cap to which the hose is attached, in Fig. 1, is allowed to escape with the water, and under such a pressure as is sufficient to project the stream to the distance named.

Fig. 3.

Fig. 3 represents the machine placed in position, upon the back of the operator.

The numerous advantages derivable from the use of this extinguisher, have already been given; but perhaps the most important one is the comparative absence of confusion on the breaking out of a fire, from the occupants of a house knowing precisely what to do. There are no two or three things thought of, and precious time lost in deciding which to do—and finally and almost invariably doing just the worst thing that could be done.

Of course these extinguishers are useful only at the first outbreak of a fire. They are chiefly useful in large public buildings, hotels, warehouses, steamboats, etc. Even in populous neighborhoods, two or three extinguishers placed at convenient distances might often prevent serious conflagrations in such neighborhoods by utterly extinguishing the fire, or keeping it somewhat in subjection until more powerful apparatus could be brought to bear.

Several public exhibitions of the efficiency of this extinguisher have been made in this State—one in this city and one in Sacramento. We were present at the trial in the latter city, which took place at the Fair grounds, at the time of holding the last State Fair. Two trials were made on that

occasion. Two small wooden structures were erected and filled with dry combustibles. Two machines were brought to bear upon it when the signal was given by the Chief of the Fire Department. The fire was quickly extinguished. A more thorough test was made with the next one, as the fire was permitted to completely envelop the building inside and out, so that its heat drove the bystanders quite a distance from the edifice. When the word was given, probably not one of all those present, except Mr. Levy himself, even after what they had just seen, thought it possible for such a fire to be put out with such an apparently diminutive apparatus. The thing was accomplished, however, and the result received with the most prolonged and enthusiastic cheering.

We have before us a pamphlet of nearly fifty pages containing a large mass of testimonials from proprietors of hotels, public buildings, etc., from all the principal cities in the Atlantic States and Europe. In this State it has been introduced by the Central Pacific Railroad Co. along their line; by the San Francisco & Pacific Sugar Refinery, the Cosmopolitan Hotel, the What Cheer House, Thos. H. Selby & Co's Shot Works, Cutting & Co's Pickle Factory, etc., in this city; by the Pioneer Flour Mill, Golden Eagle Hotel, etc., in Sacramento. Insurance companies would do well to encourage the general introduction of this apparatus, by making a small discrimination in the policies of all parties who keep this extinguisher on their premises.

The invention is now in the hands of a large incorporated company in New York city. Mr. Edward L. Levy, brother of the inventor, is the agent of the company for the Pacific Coast. He may be found at 117 Sutter street, Lick House Block. See his advertisement on monthly cover.

PERSONAL—MACHINERY FOR THE MONTANA MINES.—Mr. P. M. Randall, well known in connection with the Wheeler & Randall pan, leaves for the East on the steamer of Monday. Mr. Randall goes to St. Louis to superintend the getting up of a heavy plant of quartz machinery for the gold mines of Montana. We understand that Prof. Swallow, State Geologist of Missouri, has recently visited those mines, in the interest of certain St. Louis capitalists, for whom he has made extensive purchases and locations, which will require the employment of about 200 stamps, distributed among several localities. Before deciding upon the character of the machinery to be erected, a correspondence was opened with Messrs. Wheeler & Randall, with the view of profiting, as far as possible, from California experience in such machinery, the result of which has been the proposed visit of Mr. R. The machinery involved will call for about forty of the Wheeler & Randall pans, with their complement of concentrators and settlers—all of which will be gotten up at St. Louis and shipped by steam to Fort Benton, on the headwaters of the Missouri, which point is but a short distance from the mines, and about 3,200 miles distant from St. Louis, measuring by the river.

Communications.

In this DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER ELEVEN.

GENERAL COMPARISONS DRAWN OF THE LOSSES OF BULLION SUSTAINED BY DIFFERENT METHODS.

As \$15 per ton appears to be about the average value of the losses sustained on account of unextracted bullion, whether Augustin's, Ziervogel's, or the barrel process is employed, it is apparent that on an \$80 ore no considerable, if any advantage, would be obtained by adopting either of these methods; as even by them the loss on this account would amount to not less than twenty-five per cent. If to this is added a further loss of ten per cent. for hullion that is floated off from the batteries, an aggregate loss of 35 per cent. will accrue, or the equivalent of the losses which, it is stated, are now sustained in Washoe by treating the Comstock ores by the pan mode of amalgamation. It would be very desirable to know, what has never yet been explained, whether these losses, on account of non-extraction, are proportionate with the amount of silver and gold present in the ore treated, or consist more of the former (as I suspect is the case) than the latter metal.* The introduction, parenthetically, of the immediately preceding observation has slightly displaced an explanation which I had intended to give in its proper position, viz: that the losses above alluded to as sustained in consequence of the light matter which is floated off after leaving the batteries, when collected is technically denominated slimes, amounting to ten per cent. in value of the ore pulverized, is based on the statements made in the two last reports of the Gould & Curry Company, to which allusion, with an allied object, will be made hereafter.

From the immediately preceding observations, it will be apparent that little advantage can be anticipated by the adoption of any of the German modes that have been so much referred to, so far as obtaining a reduction in the amount of losses sustained on account of unextracted bullion; or, at all events, so far as ores are concerned of no greater value than \$60 per ton,—and less,—even though we put aside from consideration the fact that neither Augustin nor Ziervogel's method, when used alone, is calculated to extract, at the same time, the gold present in company with the silver. Until I had carefully and very minutely examined the whole subject, I had no conception that the losses sustained in all the modes which have chiefly been treated upon, were so large as above noticed; which estimate of losses, however, I believe may be considered as an extreme one. In order, therefore, to avoid as much as possible any estimate calculated to lead to erroneous impressions, maximum in place of minimum examples have been adopted for comparison.

The great distinction between the pan mode of reduction and the methods which have already been noticed, is this, viz: It has been found that the losses sustained by the former mode of procedure bear a constant ratio with the value of the hullion in the ore to be reduced, which, in the absence of actual knowledge on the subject, I will assume to be 25 per cent. (10 per cent. being allowed for loss by slimes); this, on \$100 ore, would amount to \$25 per ton;

whereas, by the other three modes principally noticed, the loss would only amount to \$15—thus giving 10 per cent. against the pan mode. It might be contended, that by the employment of any of the Freiberg methods to reduce a \$60 ore, the losses sustained would probably fall something below \$15. This most probably would be the case, but not to such an amount as would suffice to pay the difference in the cost attendant on the various methods so compared with the pan mode. This close approximation, however, of all the modes noticed, of the costs and losses attendant on the reduction of ores containing the precious metals cease, when the value of the ore, either in the unprepared or condensed condition, does not exceed \$60, and probably when ores fall much below, say \$30, the economical advantage most probably is in favor of the pan mode. The great point of divergence, as regards economy between the systems compared, I have, for the reasons given, assumed to be, when ores or mattes, or concentrated ores, run from \$50 to \$60 in value; above these amounts, the barrel and other methods become the most effective and economical. No more practical proof need be given of the truth of what has just been asserted, than by referring to some of the annual reports of the

GOULD AND CURRY COMPANY.

Several years have elapsed since, in one of the reports made by the Gould & Curry Company, it was stated that it was found more profitable to ship rich ores to England than to reduce them at their own mill, on account of the losses sustained in consequence of the great amount of hullion not reduced, amounting in fact to a large portion of the value of the ore. To the best of my recollection, at the time this statement was made, the so called first class ores alluded to were valued at about \$600 per ton. The charges for land and ocean carriage by steamer, insurance, bags, commissions, interest, and other incidentals, could not amount to less than \$150, or more probably \$200 per ton. Under these circumstances, it is not an unfair inference to suppose that the percentage of losses sustained by high grade ores at the Gould & Curry mill, at that time averaged at least from 25 up to 50 per cent.—most probably the latter. Whether any great advance has been made in respect to the treatment of first class or rich ores, since the period just alluded to, is problematical; for in the report of the proceedings of this company for the past year, an item appears stating that nearly five tons of first class ore were crushed at J. H. Dall's mill, which yielded \$511.25 per ton; the charge for which is set down at \$50 per ton;—thus practically admitting, in this instance, that the method practiced at that mill (I am informed that it is the Freiberg barrel mode) is more efficient by at least \$35 per ton, as compared with the pan mode employed at the Gould & Curry mill. No judgment, however, can be arrived at as to the extent of the efficiency of the method employed at Dall's mill, as no account of the assay of the ore prior to reduction is given; respecting this the general stockholders, as well as the world, are kept in the dark. It would be interesting to know what that assay was, and what was the mode employed; because, if the whole of the hullion in the ore was beneficiated (for the report is worded so as to lead the casual reader to infer this), Capt. Dall has succeeded in bringing into practical operation the grand metallurgic desideratum so long and so loudly clamored for by expectant Comstock and other Washoe stockholders. Whatever may be the true hearings of this case, the fact is clear, from the example given, that the pan method is esteemed wasteful and extravagant, even by its greatest patronizers, when applied to the reduction of high-grade ores. If the method employed by Captain Dall in the case last instanced was as perfect and economical as the report of the Gould & Curry is calculated to lead the reader to infer, no very much greater improvement is required than to dress \$50 and \$60 ores up to \$500 and \$600, which I pledge myself can be done for \$1 per ton, when it will easily be seen that, even at the lower estimate, it would only cost \$60 to win \$500, whereas by the ordinary pan mode only \$250 of bullion would be returned; on reducing an equal amount (or ten tons) at a cost of \$120, at the rate of \$12 per ton, leaving only \$130 net gain; whilst the gross gain by the other mode would be \$500 which minus \$60 for expenses, would form a nett advantage of \$310 over and above that obtained by employing the pan mode, as it is now done. I suspect, however, that something like \$90 per ton remained unextracted in the first-class ore of the Gould & Curry Co. above alluded to. If the loss was considerably less, the heads of the President, Trustees,

Superintendents, etc., with whom are entrusted the interests of the stockholders, must be obtuse indeed if they cannot at once see how obviously a change of system would be to the pecuniary advantage of the company.

Another circumstance connected with the two last reports of the Gould & Curry Co. is deserving of attention, not only by those interested in silver mining, but by gold quartz miners also. Those who have perused the earlier papers of this series, will scarcely need be reminded of the remarks made respecting the losses sustained, owing to the hullion which is floated away in company with other finely divided and light matters, which, when settled, is technically known under the appropriate denomination of slime. It was also then stated that I had invariably found that such slimes, when obtained from gold quartz leads, contained the metal silver in great preponderance over gold. Such slimes have now been saved for some time, according to the reports alluded to, at the Gould & Curry mine, amounting, on the average, to ten per cent. of the ore crushed.

In the report for 1867, the superintendent states that "only 606 tons of slime were worked during the year. The average yield was about fifty per cent. of the assay, or \$22.30 per ton. A curious fact in the reduction of these slimes in barrels is, that nearly all the gold is lost, while a large percentage of the silver is extracted." It would be a piece of very interesting information to know what were the relative proportions of gold and silver in the slime, and also what were the exact proportions beneficiated; or has the loss of gold only been made approximately, and not from actual assays? When these facts are accurately ascertained, I do not think it will be difficult to account for the apparent anomaly, for apparent only I believe it to be; and if any serious comparative loss of gold occurs, it would perhaps not be difficult to discover the cause and provide a remedy.

Salt Spring Valley and the Adjacent Region in Calaveras County.

[Read before the California Academy of Natural Sciences, December 16, 1867, by W. A. GOODYEAR, Ph. B., Civil and Mining Engineer.]

[Continued from Page 66.]

It will be seen that the more recent and deeper developments in the Copperopolis mines have only served to confirm the opinion expressed two years ago by the State Geologist (Geol. vol. I. p. 225), that "the deposits of copper ore in this region, like nearly all the others in California, do not appear to be included in regular fissure veins, but rather to form independent masses [the italics are mine] lying in the direction of the strike of the inclosing rocks and dipping with them." It seems, further, that they are here arranged in some sort *en echelon*. There is no evidence whatever of the existence here of a regular and continuous vein of copper ore, stretching for miles through the country, as some have supposed. (See Ross Browne's Report, p. 144.)

The finding of "copper indications," *i. e.* of small and isolated bodies of ore, distributed with some constancy through a narrow belt of country, for no matter how many miles in length, is anything but conclusive evidence of the existence, beneath, of a regular vein of corresponding length (which, by the way, if it existed, would be an anomaly in the mining world)—especially when all the developments of the most extensive workings hitherto made point so decidedly and strongly to the opinion that there is no true vein at all. Such "indications" are however evidences, so far as they go, (and they go a good ways in this direction) of the probable existence of other large bodies of ore distributed here and there along the belt in question. It is not improbable that such may be found in the future, and it would not be strange even if some of them should surpass in magnitude and value the great deposit of the "Union," which has already yielded such enormous quantities of copper, and is yet far from being worked out.

A description of the auriferous deposit of Quail Hill, in the Gopher Range, together with a similar one at Whisky Hill (called also the "Harpending mine") in Placer County, by Prof. B. Silliman, was read before the California Academy of Natural Sci-

ences, at their meeting of April 15th, 1867, and will be found in their published "Proceedings," vol. III pp. 349-351. This paper describes well the particular deposits in question, as well as the general appearance and character of the formation in which they occur. Such deposits, however, are not confined to one or two localities; but there are other points in Calaveras County at which gold is known to exist in considerable quantity, and with similar mode of occurrence. Among these I may mention Quail Hill No. 2, near the Napoleon Copper Mine, two or three miles southeast of Quail Hill No. 1, and the "Plymouth Rock," or "Austin and Hathaway" claim, at Rich Gulch, near the Calaveras River. Moreover, the geological causes, and the peculiar chemical decomposition of the rock, which have been involved in the formation of the deposits in question, are by no means confined to the localities where gold is known to occur. On the contrary, they may be traced with considerable constancy through a narrow belt of country along the southwest flank of the Gopher Hills, and stretching from the Calaveras River southeast for a distance of at least fifteen miles, and perhaps farther. Towards the northwest, the same belt crosses the Calaveras; but how much farther it extends in this direction I have no present means of knowing. It is not unlikely that a similar formation may be found to exist, here and there at least, in the same general line of strike, nearly parallel with the stratification of the country through Amador and El Dorado counties to Placer, and perhaps beyond. The possibility of this at least is worth remembering. Throughout this belt, in the Gopher Range, surface cuts and shafts, of greater or less depth, made and sunk in prospecting for copper, are of frequent occurrence. In fact, this is the same belt that has been so often mentioned as "the second important copper-bearing belt of Calaveras County," and located some six or seven miles southwest of the main copper belt of Copperopolis. The "importance" of this belt, on account of the copper ores which it contains, has been most grossly exaggerated. An amusing illustration of this fact is to be seen in a "map of the copper mines of Calaveras County," published a few years since, which represents the whole region in question as literally covered for miles with highly colored "locations" or "copper claims;—the whole of which, with few exceptions, and these due not to copper but to gold, have served no further end than that of rendering their locators and owners sadder and wiser men. At one locality, indeed, viz., the "Napoleon mine," a body of copper ore was found, which in many countries would have been remunerative, and was worked to a considerable extent; but the working here was attended only with loss, and was some time since entirely discontinued. It should be remembered, however, in speaking of the copper mines of California, that not only have they had to contend with the general ignorance of copper mining, and especially of copper metallurgy which has existed throughout the State, and with extremely high prices for labor and transportation; but also that, for a year or two past, the largely increased supply of ore from the mines of Chili in South America, and elsewhere,—together with the diminished and consequent low price for metallic copper, reacting with increased effect upon the value of the ore,—have told with crushing weight even upon the best mines. There are certainly not more than one or two, perhaps not even a single deposit of copper ore in the known world, which surpasses or equals, in magnitude and intrinsic richness combined, that of the "Union" mine of Copperopolis; and yet, it is said, that even the "Union" itself, which is the only mine now active at Copperopolis, is hardly more than paying expenses at present rates. So far, then, as my observations extend, there is simply nothing whatever in this "second copper belt" which can for some time to come, justify the expenditure of money in searching for copper here; though it is not impossible that, besides the "Napoleon" mine, other deposits of ore may exist within the belt, which at some future time, and under more favorable circumstances of labor, fuel and transportation, may become of value for the copper which they contain.

[To be Continued.]

*A curious instance of the contrary will hereafter be cited from the last report of the Gould & Curry Company. While this was being corrected for publication, Mr. H. C. Bennett, of this city, very kindly obliged me with the sight of a very well digested series of statistics respecting the affairs of the Hale & Norcross Company, for the year ending 1st of March, 1867, in which, amongst other valuable tables, there are separate columns for the purpose of not only noting the percentage of gold and silver in the ore, but also separate columns detailing the percentage of loss sustained on each metal. These facts will be more particularly noticed next week.

Mechanical.

Transferring Power—Interesting Facts.

One of the most noticeable and interesting demonstrations at the Paris Exhibition, appears to have been the device of M. Hirn, for transmitting power to great distances, consisting in the employment of endless wire running over large and peculiarly constructed pulleys, one of which is at the transmitting, and the other at the receiving end of the range. This system of conveying power is termed *teledynamic*—employing power at a distance; as *telegraphy* is used for writing at a distance or afar off. This mode of conveying power, of course, is not new; neither is the principle involved in Mr. Hirn's device novel; but the application of the principle, in the manner indicated, is both new and valuable, and was adjudged, by eminent mechanics, as highly important as regards its future. In a well digested review of the Exposition, written by Robert Mallet, F. R. S., of London, we find the following:

At first sight, or to the casual observer, M. Hirn's arrangement, which was without interruption at work in the park, where it transmitted through a wire not thicker than a large pencil about 25-horse power (nominal), to actuate pumps (supplying the building) at a distance from the source of power of several hundred feet, appears but one form of the well known strap or belt, with its strap pulleys; and it is so much, but it is also much more, for it involves and is based upon a principle which had not before been made available for the transmission of power to great distance. This may be properly stated thus:—When work—that is pressure and motion together—has to be transmitted by tension through a cord or fiber, such as a wire or rod of iron, or other material, a given amount of work in a unit of time can be always transmitted through a smaller and smaller section of fiber or rod in proportion as we increase the velocity with which a point in the transmitting fiber or rod travels; so that the product of the pressure and of the velocity with which it acts to produce work shall be constant. For example, a cylindrical bar of iron of one inch diameter, we may say, can transmit a pull of ten tons through itself without stretching; and if, that pull being always on the rod, a point in its length passes a given fixed point at the rate, let us say, of five feet per second, then at that point the rod is transmitting work at the rate of ten tons \times 5 ft., = 50-foot tons per second. But if we have another rod of the same material, of only one-tenth of an inch in diameter, which will therefore have 1-100th the cross section of the one inch bar; this will bear, without stretching permanently, the 1-100th of ten tons, or 1-10th of a ton. Now, if this last rod transmits this pressure of 1-10th of a ton past a given fixed point at a rate 100 times as fast as in the former instance, then the work transmitted by the small and the great rod shall be equal in equal time; or 1 in. bar—10 tons \times 5 ft. = 50-foot tons; 1-10th-in. bar—1-10th ton \times 5 ft. \times 100 = 50-foot tons. But this last is a mere wire, and will be light and flexible enough to be passed round the rims of large pulleys at such high speed, and by friction on these rims (friction for equal pressures being the same at all velocities within large limits) to transfer the work to their axes in way of rotation. Thus, theoretically, the power of the largest steam engine in the world might be transmitted to any distance through a human hair. The practical limit with steel wire is found, however, about where the diameter is reduced to from two to 3-10ths of an inch. The limit of velocity is only that at which by centrifugal force or want of perfect balance, the pulleys might become deranged or unsafe. M. Hirn has, by this beautiful and simple adaptation in practice of a dynamic principle, succeeded in transmitting the power which drives large factories to great distances: in some cases as far as across the Rhine near Schaffhausen.

PARAFFINE AS A LUBRICATOR FOR HEATED MACHINERY.—A suitable lubricator for hot air engines and others, where portions of the apparatus are raised to a high temperature, has been a great desideratum, the ordinary oils under the circumstances becoming clogs, rather than aids to the motion of machinery. A French engineer now recommends paraffine very positively as answering all the purposes required. The article need not be very pure; a mixture with other fatty substances answering a very good purpose.

THE STEAM JET CUPOLA.—The use of the steam-jet to create a draught in a narrow chimney has been understood, says *Engineering*, ever since Trevithick thus employed it in 1803, or, at least since Nicholson fully described its action, and patented certain applications of it in 1806. A steam-jet was tried many years ago at Caerphilly, in the wide throat of a blast furnace; but Mr. Edmonds, who made the experiment, soon found that it would not answer merely because the throat of the furnace was so wide that the jet drew its air, not through the charge below, but from the large space immediately about it. In the small chimney of the locomotive, as used by Trevithick and by Hedley, long before Geo. Stephenson could bring himself to see its advantage, the steam-jet, whether of waste steam or live steam, is effective, and is found not to be greatly more costly, even with live steam, than would the working of mechanical blowers delivering the same amount of blast, at least where the blast is to be delivered under the slight pressure required for cupola furnaces. Messrs. Woodward Bros., of the Queen's Foundry, Ancoats, Manchester, have now erected upwards of sixty cupolas having closed tops and charging hoppers, and having a narrow sheet iron chimney flue, taken off at the side, through which a jet of live steam is discharged as the only means of producing a draught. Engines, fans, or other blowing machinery are thus dispensed with. Some of these cupolas have been at work since April, 1865, and among these who have been supplied with them are Messrs. Robert Stephenson & Co., Messrs. Galloways, of Manchester, Messrs. Beyer, Peacock & Co., Messrs. Dehson & Barlow (Belton), the Manchester Steel and Plant Co., and many other well known firms.

ARTIFICIAL GRINDSTONES.—Ransome's artificial stone—the silicate of lime—has been found to make excellent grindstones, remarkable for their uniform texture and fineness of grain. A pair of these were lately tested in England against a pair of Newcastle stones under similar conditions. According to the report of this trial a bar of steel three-fourths of an inch in diameter was placed in an iron tube fixed to the frame of the grindstone, in the end of which was a spring which pressed against one end of the steel rod, and thus kept the other end constantly against the grindstone. In sixteen minutes one-quarter of an inch of this rod was ground away by the artificial stone; the same rod was placed on the Newcastle stone, having 20 per cent. greater surface than the other, and after eleven hours of similar contact the rod was ground away one-quarter of an inch—the value of the stones being as one to thirty-three. From an examination of specimens of this stone on exhibition in New York, we are forced to believe this report is greatly exaggerated.

MAKING HINGES.—A French machine for manufacturing wrought iron and brass butt hinges has lately been brought to this country. Sheet iron or sheet brass is employed, of proper thickness. The hinges are made complete for market in one single machine. Two strips of metal enter the machine on one side from coils; on the opposite side is placed a coil of commercial wire, which enters and forms the huge rivets; the screw holes and countersinks all being made in one operation. One hundred hinges of the smallest size leave the machine per minute, in a condition to be packed for market. One machine will make five different sizes of huts—four inch hinges being made at the rate of from twenty-five to thirty per minute.

A MR. DAVIS, of Boston, has devised a process by which wood is made to take the place of paper in covering the walls of rooms.

A VESSEL recently arrived at this port with a large amount of goods from China, purchased at prices so remarkably cheap that the custom house officers at that port would not believe in the veracity of the invoices, and seized the goods as falsely valued by the purchasers. The probability is, however, that the invoices are correct, it takes so little to sustain life in China and wages are so low. In the importation were handsome sets of porcelain bought for \$4 the set. Beautiful fans, painted by hands in brilliant colors, with figures of dragons and Chinese beauties purchased at a cent each. Spades for garden use bought at a cost of a few cents each. Straw hats of good quality invoiced at a cent each. Nice baskets, in sets of four, costing in the Celestial Kingdom but four cents a set, and other articles equally low.

Scientific Miscellany.

The Dodo.

Mr. George Clarke, of Mauritius (Isle of France), has recently discovered, in a swamp on that island, a large deposit of the bones of the famous dodo. By this discovery an entire skeleton of this singular bird has been given to science. The history of this bird presents one of the most remarkable instances on record of the extinction of an entire race of animals within the age of man—the last individual of the species having probably disappeared about the year 1700. Another most remarkable scientific fact connected with the history of this bird, is the circumstance, that until the discovery just noted, the data for determining the species to which it belonged was much less than those left by many birds and other animals who perished long ago, anterior to the probable existence of man on the globe. One of these birds was exhibited in London in 1638; but the descriptions left of it from that early age of natural science, are too crude to determine even the family to which it belonged. The existence of this singular bird appears to have been confined to the group of islands of which Mauritius is the largest. When those islands were first discovered, the bird existed in great numbers, and was killed by sailors for food. Soon after the Dutch took possession of the islands, in 1644, it began rapidly to decrease in numbers, by reason of their ceaseless hunting of it for food, and from its natural enemies—dogs, cats and rats, which accompanied the advent of the Dutch to those islands—the latter devouring the eggs and young in the nests, which were always on the ground. When the French succeeded the Dutch, in 1715, it appears to have entirely disappeared.

This bird belonged to the order of *colombæ*, or pigeons. It was nothing more nor less than a gigantic pigeon, with long legs and small wings. The latter were so feebly developed as to be of no use for flight; while the former were not much better even for walking. Its general shape, feathering and natural awkwardness, resembled more nearly a very young, than an adult pigeon. One naturalist has described it as a very clumsy bird, resembling "a young duck, or gosling, enlarged to the dimensions of a swan." Probably the helpless condition of this bird, which may be reasonably inferred from the above description of it, has led to its early extermination and probable non-removal to any great distance from the locality where it first appeared upon the earth. Its fossil remains have never as yet, we believe, been found outside of the Mauritian group of islands, which are situated in the Indian Ocean, some eight or ten degrees east of the large island of Madagascar. It is said to have laid but one egg, about the size of that of a pelican's, and lived mainly upon tropical fruits, as they ripened and fell from the trees.

Previous to the late discovery of the skeleton by Mr. Clarke (which, however, is slightly imperfect, in lacking the tip of the wing), the only portions of a skeleton known to be in existence were a head and foot at Oxford, England, a skull at Copenhagen, a foot in London, and a beak at Prague. There are several drawings and paintings yet in existence, which were made by artists who had seen it in its native islands, and which are supposed to be quite truthful in their delineation.

OXYGEN IN THE MARKET.—A company has been formed in Paris under the style of Jos. de Susini & Co., for the manufacture and sale of oxygen to be mixed with ordinary illuminating gases. The calculation is that an addition of one-third oxygen will be equivalent to multiplying a given quantity of illuminating gas eight times, the price of oxygen being fixed at only 2½ times that of ordinary gas. The superoxygenated gas will be used in lighting the International Lecture-room of the Exposition.

THE GULF STREAM AND THE LATE EARTHQUAKES.—One of the most noticeable effects of the late earthquakes in the West Indies, is said to have been an increase in the velocity of the current of the Gulf Stream, near the Florida shore, from three and a half to four miles per hour—or over fourteen per cent. The current is now so rapid as to make the passage of the Key West reefs quite dangerous—vessels are almost forced upon them by the increased current, which there sets up from the southward and eastward. This increase in the current of the Gulf Stream is attributed to an upheaval of the ocean bed, from the region of St. Thomas towards Cuba; thus, to a certain extent, closing up the Mona passage between San Domingo and Porto Rico, and also blocking up the windward channel between Cuba and Hayti. By this change in the bottom of these seas, a greatly increased volume of water is forced up through the old Bahama channel, from whence it strikes across to the Florida reefs with much greater violence than formerly. By reference to a map, it will be seen that Cuba, San Domingo, Porto Rico and the entire group of islands to the southward and eastward, including our new purchase of St. Thomas, are made up of the more elevated portions of a submarine mountain chain. It is not at all unreasonable that a portion of this range should have been slightly elevated during the recent convulsion in that region. The result of such elevation would infallibly produce such a change as is reported to have occurred in the velocity of the Gulf Stream, while a subsidence would produce an opposite effect.

TO OBTAIN FLUORINE.—Many attempts have been formerly made to obtain this highly electro-negative element in a separate state, but without success. M. Prat now avers that he has isolated fluorine by heating fluorine of lead either with nitrate of potash or binoxide of manganese. The result of this operation is a gaseous mixture of oxygen and fluorine; from this the oxygen is abstracted by passing the mixture over heated oxide of barium. The binoxide of barium is formed, while the fluorine is left in the form of a gas. M. Prat states that it is colorless, and has an odor resembling chloroform. It decolorizes indigo; reddens litmus; fumes on coming in contact with air; gives dense fumes with ammonia; decomposes water, as well as hydrochloric acid; unites with hydrogen in diffuse light, forming hydro-fluoric acid; and last, it combines with all metals, excepting perhaps platinum and gold. M. Prat's experiments are to be repeated before a committee from the French Academy of Sciences. He seems to have selected a most direct path to success, by first obtaining a mixture of two gases, which, it is well known, do not combine chemically.

ATMOSPHERIC METER.—Prof. De la Rive, of Geneva, Switzerland, has invented an instrument for determining the transparency of the atmosphere. It consists of a double telescope with a single eye-piece, by which two objects at known distances may be compared. Thus the effect of the stratum of air between may be noted. The inventor thinks that a measure of transparency may be of great importance in a sanitary point of view. He agrees with Pasteur, who supposes that the light, dry fog which sometimes intercepts the light is caused by myriads of organic germs floating near the earth, which become transparent when saturated with moisture, and are swept to the earth by heavy rains. Vaillant, however, believes that the haze sometimes seen in the weather is the effect of variations in the density of the atmosphere, for reflected light, passing through such a medium, would not give a distinct impression of distant objects.

HOW TO PUT OUT GREEK FIRE.—Greek fire is not so dangerous as is represented. It consists of phosphorus dissolved in bisulphide of carbon. When thrown upon any combustible material the liquid rapidly evaporates, and the phosphorus, being left in a comminuted condition, bursts into flame, evolving suffocating vapors of phosphoric acid. Water will only temporarily extinguish the flame, which bursts out again when the fire dries up; but the fire may be immediately and permanently extinguished by a solution of common washing soda—one pound to a gallon of water.

THE OLYMPIC EXHIBITION.—One of the greatest objections to living in a large city is the restriction of those healthful exercises which are calculated to develop the human frame, and give strength and vigor to the inhabitants. Where sedentary habits are contracted by long continued want of exercise, the entire frame becomes enervated, and instead of being what nature intended us, we become effeminate and unable, particularly in this climate, to withstand even the slightest change of weather. This can be seen by noticing the many dwindled forms and sunken chests which we daily encounter upon the streets, and the frequent complaints of colds and similar affections. Nothing so fits a man for the daily business of life as proper exercise. It gives him strength and health, and consequently life. While he is exercising his body, his mind naturally throws off all cares, and after having rallied his lax muscles, and sent the warm blood coursing through and to the ends of the minutest veins, until the perspiration flows freely, he is ready to go back to the desk or behind the counter and attend, with pleasure, that labor which would otherwise appear irksome. It does more; it gives a man confidence in his strength, and renders him active; and should circumstances place him in a position in which bodily strength and activity would be required, it might save him many a severe bruise or perhaps more fatal hurt.

The Olympic Club of this city has demonstrated to the community what benefit can be derived from constant and proper exercise; and we can say, without fear of successful contradiction, that few athletes, even professionals, can excel in some of the feats performed by members of this Club. At their exhibition on the evening of January 31st, some of the feats were really astounding, especially when we recollect that, for the most part, the actors are clerks and persons whose business requires them to be in constant confinement. The feat of balancing on a tight-rope, *a la Japanese*, with nothing but a Japanese umbrella or sunshade for balancing purposes, was performed by W. S. Lawton with great success. He walked the rope apparently with impunity, opening and shutting the umbrella, and performing other difficult feats. C. A. Bennett, the well known strong man, handled various dumb-bells, weighing from fifty to a hundred pounds each, with ease, holding one pair weighing fifty-four pounds each at arm's length, and then raising them slowly up over his head; then taking up a monstrous one, bearing the figures 152—meaning that it weighed that amount—he raised it over his head at arm's length, and holding it in that position, paced the hall back and forth. Ladder balancing by D. Wilder was well performed, and elicited frequent applause. Geo. H. Strong performed the difficult feat of supporting with his feet a large ladder, having fastened to it in the form of a T, five other ladders, while Master Tappiener, a lad of some seven years, climbed over it. Zampillerostation was performed by L. P. Ward and the Cook brothers, and called forth loud applause. Other feats of strength and agility were performed, all with the same success, and all present were impressed with the idea that the Olympic Club is a good thing. After the vigorous exercises had been gone through, the more light and airy exercises of the dance were entered upon, all joining who felt disposed. The entire entertainment reflects credit upon the members.

A MAMMOTH WELL.—The chief supply of water for the city of Cairo, in Egypt, is derived from a single well of mammoth proportions—300 feet deep and fifteen feet in diameter. Mules are employed day and night in raising water from this well.

HENDY'S CONCENTRATORS.—The North Star Company, of Grass Valley, has recently put in six of Hendy's concentrators. The Secretary writes to the office in this city that these concentrators are doing well—quite as well as had been expected.

The tallest spire in Europe, the Munster of Strasburg, is 466 feet high; the great pyramid of Cheops is 480 feet, but is said to be exceeded in height by some of the Australian forest trees.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

72,789.—TRUSS FOR HERNIA.—A. F. H. Braun, San Francisco, Cal.:

I claim the screw, a, having its bearing against the lever, D, the spiral spring, d, through which the screw passes, and the nut, b, for regulating the pressure of the pad in combination with the frame, C, axis, D, substantially as and for the purpose described.

72,934.—MARKING GAUGE FOR SEWING MACHINES.—Wm. M. Stoddard, San Francisco, Cal.:

I claim the device for marking for tucks, arranged in relation to the sewing machine substantially as described, and consisting of the adjustable guide bar, A, marker, G, having a slot, I, spring, a, and adjustable spring-bar, J.

72,645.—REVOLVING OVEN.—John Adam Kinkele, Sacramento City, Cal.:

I claim, 1. The oven, constructed as described, consisting of the inner wall B, placed between the outer case, A', having cold-air openings, a, and the oven, C, all supported by an annular plate upon the foundation, A, the hot and cold annular air-chambers, II, II', communicating with the common flue, J; the revolving hearth E of the oven, supported upon the plate E' by a pivot, and operated by means of the gear wheel, L, as herein described, for the purposes specified.

2. The rotary hearth, E, when constructed of tile or fire-brick, in combination with the oven, C, concentric wall, B, and casing, A', as herein described, for the purpose specified.

72,788.—ADJUSTABLE HASPS AND HOOKS FOR DOORS.—Wm. Bisbee and Fleming G. Hearn, Yreka, Cal.:

We claim, 1. The spring, C, in combination with the box hasp, B, for self-adjustment in contraction and expansion of doors, etc., substantially as above set forth and described.

2. The said spring, C, in combination with the adjustable hook, F, and hasp, B, substantially as and for the purpose above set forth and described.

72,885.—SCRIBE-HOOK FOR WEATHER BOARDING.—John Nester, Portland, Oregon.

I claim the weather-board hook, M, having the shoulders, I, I, when used in combination with the scale, O, slide gauge, F, spur, G, and sliding marker, B, the whole being arranged in one instrument, and forming a combined tool of the character and for the purpose set forth.

73,276.—IMPROVED RAILROAD SNOW PLOW.—John Rosco Adams, Cisco, Cal.:

I claim 1. The dash-board or share G, and the false bottom or slide F, operated by the hand-wheel g, and cord or chain g', substantially as and for the purpose specified.

2. The bonnet or gate E, for retaining the load upon the incline, and the hand-wheel and pins b, pawl d, and cord or chain b', for raising or lowering said bonnet, substantially as described.

3. The side pieces D and D', movable in the ways i i i', substantially as and for the purpose described.

4. The platform C, upon which the hand-wheels are placed, as described.

The object of this invention is to provide an improved engine or device for removing the snow from railroad tracks, and is so constructed and attached to locomotives that light snow will shoot up the incline of the frame, and be deposited at either or both sides of the track. Heavy bodies of snow, in deep cuts, can also be loaded upon it and carried to any convenient place of deposit.

To accomplish this a frame of wood is mounted upon a low truck, at an incline of from forty to sixty degrees. The shovel is made wider at its mouth, and has upright side pieces, which are curved and support a bonnet or gate, that can be let down to retain the load upon the incline. This bonnet is easily lowered or raised by proper appliances, worked by a hand wheel. Side pieces, which move in ways, are placed upon each side of the frame, to be moved down to the upright piece, when loading the plow. A bar passes lengthwise through the frame, above the axles, and is attached to the back part of the incline frame, passing through an opening in the rear end. This

bar is for the purpose of imparting strength to the plow, and providing a sufficient attachment to the locomotive. It has a sufficient sized opening in the rear, where it passes through the back part of the frame, to admit of the necessary lateral play required for turning curves.

72,977.—IMPROVED COMPOSITION FOR ROOFING.—Allen Cody, James Bartlett, and Henry M. Jones, Ukiah City, Cal.:

We claim a compound cement for roofing purposes prepared and applied substantially in the manner and for the purposes set forth.

The object of this invention is to provide a plastic composition, for the purpose of roofing, which, upon drying, will form a solid roof, which will be proof against the extremes of heat and cold, and impervious to water.

A mixture or mortar is made of certain mineral and organic substances which is spread over the roof prepared by laying the sheathing boards close together, or better to have them tongued and grooved, so as to form a tight and level surface; this mortar is then spread over the surface with a trowel, until it is about an inch in thickness. This having been done, it is suffered to remain undisturbed for two days, to require the necessary firmness, when a thin solution of the same mortar is made, by adding a certain liquid until it is of the consistency of paint. This preparation is then spread over the mortar with a brush, to fill up any fissures or defects which may have been left in the act of spreading, or which may have been produced in the process of drying. By this means it is claimed by the inventors that they are enabled to secure a roof that will withstand the most intense extremes of heat and cold. The thin solution, when used as a common paint for shingles, etc., prevents them from shrinking or warping from the weather, and is also a most effectual fire-proof paint.

73,007.—IMPROVEMENT IN FIRE-ESCAPE.—Edward Hawthorne, Mountain View, Cal.:

I claim the apparatus, constructed, arranged, and operated substantially as and for the purpose described.

The nature of this invention consists in providing a ready means of escape from burning buildings, and has been named the "Nonpareil Fire Escape."

This end is accomplished by attaching to each side of the casement or window, upright frames of iron with transverse arms. Across these arms are placed a bar having a ring in it, to which the lowering apparatus is attached.

The lowering apparatus consists of a square frame, with upright posts at each corner, and having flat, horizontal bars bolted to the uprights. Midway between the bars, at right angles, is another bar, having a ring in its center, through which a rope is placed, connecting the machine to the frame above. The lower portion of the apparatus consists of a flat bottom, and the upper part is attached to a canvas bag, by means of eyelets, rings, and cords, the apparatus being so arranged as to be lowered by the person occupying it. When lowering from bay windows, and for avoiding such like projections, two curves may be employed—with extension arms and eyes in their ends.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

COLUMBIA HOMESTEAD ASSOCIATION.—San Francisco. Capital stock, \$61,200. Trustees: J. B. Wooster, W. Turnbull, R. H. Randall, S. P. Taylor and J. W. Burnham.

MISSION VIEW HOMESTEAD ASSOCIATION.—San Francisco. Feb. 5th. Capital stock, \$33,600; 112 shares. Trustees: W. Monahan, Peter Ross, Gerald Cullan, Wilbur F. Bayley, J. Marks, J. W. McKenzie and Martin Brnfield.

THERE are nine different steamship lines plying between New York and various European ports. These ships, during the past year, have transported in round numbers, 222,000 passengers, over 1,000,000 tons of freight and specie to the amount of \$43,000,000.

EXACTIONS OF ROYALTY.—Queen Victoria has fixed in the pulpit of the Chapel Royal a sand-glass measuring only eighteen minutes.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools.

To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Seely.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of its arrangement, it was, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—J. H. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text-books.—James Denman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Bragdon.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boote.

A gentleman of varied learning and ripe culture, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bullfinch.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap, and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times.

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Travelling Agents.

February 8, 1883.

CITY STOCKS.

In city shares the market has been more active during the past week, and the descriptions of stocks offered and sold more varied than for some time past. We note sales of Oakland Railroad stock at \$62, and North Beach and Mission at \$60. The six city railroads, according to the returns made to the Internal Revenue Department, upon a legal tender basis, ranging from 71 to 75 on the dollar, show their aggregate earnings to have reached \$839,551 during the year 1877. In insurance stocks we find that Pacific sold at \$120@119; Fireman's Fund at \$86.50@86, and National at \$71. The Merchants' Mutual Marine Insurance Co. will disburse a dividend of 1 per cent. on its capital stock on and after the 10th instant. San Francisco Gas stock was in the market at \$65@65.25. The usual monthly dividend of 1/4 per cent. was paid on the 1st instant. California Steam Navigation sold at 79 per cent.

The San José Savings Bank filed articles of incorporation in the office of the Secretary of State February 1st. Capital stock, \$100,000, in 1,000 shares of \$100 each. The principal place of business will be in San José. The following named persons are the Directors for the first six months: James C. Cobb, W. Mobary, H. Hoffman, W. W. McCoy, James Hart, L. Archer and Hiram Schartzner.

MINING SHARE MARKET.

We report an active market for the period under review, and the usual line of stocks dealt in was somewhat extended. Speculative feeling is tending towards a very decided advance in spring, and the prospects of such a rise are considered very favorable by the best informed. Information from the Nevada mines is meagre, though prospecting continues to be quite extensively carried on. Several companies that have been idle for a long time past will resume work within a few months, and a more general activity than usual may be anticipated throughout the whole extent of the Comstock lode.

HALE & NORCROSS—has been less active, receding from \$3,300 to \$3,100, and closing at \$2,925, seller 60. This company has now about 1,000 tons of ore on hand, said to average from \$40 to \$45 per ton. The superintendent has been telegraphed to start two mills, and it is thought that by the 10th they will be in running order.

CROWN POINT—was dealt in to a moderate extent and at fluctuating rates, rising from \$1,100 to \$1,265, declining to \$1,175 and \$1,140, then jumping to \$1,330, and closing yesterday at \$1,280. The 600-foot level at present produces nearly all the ore that is extracted from the mine. It continues to look well in going east, and the whole "raise" below this level is said to be in good ore. The west body on the same level averages four feet of ore. In drifting north 35 feet below the 500 level, they continue to find good pay ore, and a cross-cut west from the same, it is reported, is leading into the same character of ore as that found in raising on the west body of the 600 level.

SAVAGE—was less active early in the week, but sales increased at the close, advancing from \$135 to \$142.50, declining to \$136, and closing at \$142. The ore extracted during the week ending February 1st amounted to 1,728 tons, showing an approximate value of \$36.62 to the ton.

CHOLLAR-POTOSI—has been quite active under an advance, improving from \$172 to \$196, receding to \$177, and closing at \$187. The product of the old mine during the week ending January 30th amounted to 400 tons; the various mills took 557 tons, leaving 2,283 tons on hand. The average yield of the mills during January is reported not to be over \$15 per ton. The sinking of the new shaft is said to be pro-

gressing rapidly; the rock is getting harder. On the 3d instant, the shipments of ore amounted to 104 1/2 tons. The bullion product during the month of January aggregated \$41,000.

YELLOW JACKET—was active at the close, selling within a range of \$873@845, and closing at \$840. Our information concerning this claim is quite meagre. It is reported that the south shaft had bulged considerably early last week, and work was suspended until the same is repaired.

ALPHA—suddenly rose to \$1,100, then sold at \$1,000@1,050, and at the close \$1,050 is bid. This claim lies west of the location of the Imperial-Empire shaft, and this advance is based upon the expected favorable developments through it in that direction.

IMPERIAL—was less inquired for than last week, receding from \$205 to \$196, then selling at \$199, seller 30, and at the close obtaining \$200, buyer 30. On the 4th instant the shaft contained 160 feet of water, with the pumping machinery in good running order. At present the teams are carrying 25 tons of ore to the Rock Point and 35 tons to the Gold Hill mill. Seventy tons is at present the daily product of the Alta mine. The receipts of bullion in January amounted to \$43,833.

KENTUCK—sold at \$257.50@285, and closed at \$275, buyer 30. The bullion receipts of January, so far as advised, reach \$47,782.

OVERMAN—advanced from \$70 to \$85, then sold at \$77@80, and closed yesterday at \$90, buyer 30. BULLION sold at \$34@32.

GOULD & CURRY—is quiet, small sales having been made at \$410@430, closing at \$430. The ore product of this mine during the month of January amounted to 1,389 1/2 tons, and bullion yield to \$14,476.

EMPIRE—is also quiet, realizing \$195@200. In January, the bullion yield aggregated \$16,050. The ore has been running low of late; nevertheless this company has been able to defray all its expenses out of the lessened product. BELCHER rose from \$170 to \$195, buyer 30, and at the close sold at \$190.

GOLD HILL QUARTZ—has been steady, selling at \$90@94. In January the bullion product amounted to \$6,837.44. CONFIDENCE at \$52.50@60. EXCHEQUER declined from \$28 to \$25, and closed at \$26. The assessment now due on this stock will be applied to the mine, work upon which will be resumed in a month or two. DANNEY advanced from \$6 to \$16, and at the close \$10 is bid. An assessment of \$2 per share, or \$8 per foot, was levied on the 1st inst. SIERRA NEVADA sold within a range of \$15.50@12. An assessment of \$10 per share was levied on the 5th inst.

AMADOR—continues to be firmly held; it can be had for about \$200. This claim produced \$43,500 in bullion during January, and the expenditures amounted to \$10,500. Deducting the dividend of \$6 per share, amounting to \$22,200, payable since the 7th inst., they have a surplus of \$13,000.

The sales in the Board during the past week have been as follows: Regular sessions, \$1,577,296; open sessions, \$379,070—total, \$1,956,366.

THE BEST IN AMERICA.

The Mining and Scientific Press,

Is the Largest and Best MINING AND MECHANICAL Newspaper Issued in the United States.

DEWEY & CO.,

Patent Agents, Publishers, Book and Job Printers, 505 Clay Street, San Francisco.

THE MINING AND SCIENTIFIC PRESS is published every Saturday. Each issue comprises sixteen pages (4 columns), and furnishes more valuable reading matter than any other weekly journal in California.

To the practical mechanic, metallurgist, prospector, millman, mine holder or worker, it is worth many times its subscription price. It files contain a record of the improvements in mining machinery, the progress and development of the mines, and all new methods and processes for working and

SAVING PRECIOUS METALS.

All progressive information, in fact, transpiring with the times—which cannot be obtained from books.

The Mining and Scientific Press is now in its FIFTY-SEVENTH VOLUME, and enjoys a large circulation. It received the following hearty endorsement of the California Miners' State Convention, held at Sacramento, January 17th, 1880:

Resolved, That we regard a mining paper or journal of great importance to the mining interests of California, and recommend the Mining and Scientific Press, of San Francisco, to the consideration and support of the miners of the Pacific coast.

Terms of Subscription.—One year, \$5; six months, \$3—in advance. Send for sample copies. Remittances may be made by mail at our risk, if parties sending will register their letters, or send money order.

AS AN ADVERTISING MEDIUM throughout the whole Pacific States and Territories, the Press is unsurpassed. Rates moderate.

SPECIMEN NUMBERS of the Press and Patent Circulars, sent free. DEWEY & CO., San Francisco Jan. 1st, 1883.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Feb. 7, 1883.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.	Per ton.
12 per cent. ore.....	\$18 00	\$22 per cent. ore..... \$43 50

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, Jan. 25th: We have two different statements this week in regard to the I. X. L. mine; one that the mine is turning out not less than a ton each day of No. 1 ore; the other, that though they are taking out ore of very fine quality, the quantity is small.

One day this week the Pennsylvania Co. cut a small feeder of quartz, which shows a very silver largely. No doubt is entertained that this is a feeder to the main lode, pitching rapidly toward it, which, as an indication of the quality of ore which may be expected in the lode, is of great importance.

The Consolidated Monitor Co. have decided on a point for the immediate opening of one of their lodes, by running a lateral tunnel from a gulch above their present works. A new location, comprising about 2,000 ft. of the lode from the foot of Boulder Hill—Eagle Gulch—to the starting point of the new tunnel, has been made for the company, and work will be started on Monday for the purpose of proving its value.

Amador County.

Ledger, Feb. 1st: The Kearsing mill in this place, which has been idle for some time, has been put in good condition, and is now pounding away. They are now working the tailings from the Coney & Bigelow mill for the purpose of saving the sulphurets—using the Ambler process.

Mr. James Tullock, one of the lucky quartz miners of Amador county, last week struck a vein of rich quartz at Central Hill, about four miles northwest of this place. The company have named their location the "Central Hill Claim," and are making arrangements to sink a shaft upon the lead. The surface croppings prospect rich in free gold.

Butte County.

Oroville Record, Feb. 1st: The owners of the Jennie Ledge, in Granite Basin, have been running the mill of Messrs. Halstead & Sparks, with rock from their ledge. Some 65 or 70 tons of ore were worked, producing amalgam to the amount of about \$12.50 per ton. We understand that the Jennie has paid Halstead & Sparks for crushing 300 tons of ore, with the proceeds of which they will erect a 16-stamp mill.

Calaveras County.

Chronicle, Feb. 1st: The Palomo mill has been started to work. Everything works as smoothly and nicely as though it had been in operation for months. The battery is composed of eight stamps, weighing 600 lbs. each.

Morton & Co. are engaged in sinking a shaft on their claim. They will erect a mill in the spring.

San Andreas Register, Feb. 1st: A great deal of excitement has been created in our town within a few days over the discovery recently made by B. K. Thorn. It now appears that the lode is much wider and richer than it was at first supposed to be, and recent prospecting discoveries have established the fact that both sides of Thorn's first location is equally as rich, if not richer, than the claim upon which he has planted himself. We have examined a great deal of rock, said to be from the main lode, and have seen it carefully crushed and washed, and all we have to say about it is, the like thereof we have never before seen.

Amador Ledger, Feb. 1st: Business at Cat Camp is fast improving, and mining is very brisk there at this time.

Inyo County.

Virginia Enterprise, Jan. 30th: Mr. C. F. Duval arrived in this city yesterday from Cerro Gordo district. He brings some rich and beautiful specimens of silver ore from the mines of Cerro Gordo; also a small amount of bullion in bars. Not much bullion will be taken out before next summer. Most of the Mexican miners have left for the new placer mines in the Coso country, where they can do very well during the winter and the wet months of spring.

Los Angeles County.

News, Jan. 17th: The main Delphi ledge has been struck in the tunnel, which has been run through hard rock for the last six months, at the depth of 2,100 ft., and the ledge is full 4 ft. in width, and of its accustomed richness. This mine has always been the richest one in the district. The new mill of the Delphi Co. is now completed, with roasting furnaces for the working of sulphurets.

The Relief ledge has been struck at a great depth, and is producing rock of extraordinary richness. Col. Rand, the super-

intendent, suspended operations upon the mine, except in the way of sinking, for the purpose of proving the richness of the vein at a great depth. This work has now been accomplished, and after sinking through hard rock to a distance of over 300 ft. from the surface, the mine has proved rich and the vein substantial and permanent.

The mines of the new El Dorado district, near Sageland, 30 miles east of Havilah, are yielding rich returns. The St. John Co. is now crushing ore from its mine continually, and the average yield is about \$40 per ton. A fourth interest in this mine was recently sold to J. C. Birdseye for \$20,000. An undeveloped mine, known as the Phoenix, in the same district, recently sold to Bridger & Kearney for \$13,000.

Lake County.

Courier, Jan. 31st: Late accounts from the gold mines in the northern part of this county are encouraging. Three companies are now at work there, and judging from the preparations being made, they intend to stick to it. Other places in this vicinity give fair prospects, and gold in small quantities can be found in almost every ravine in this section of the country.

Napa County.

Register, Feb. 1st: A very promising discovery of cinnabar has recently been made northwest of Pine Flat, beyond the Sonoma county line. Specimens of the ore have been brought into town, which excel in richness any that we have ever seen. It is reported that the true ledge is discovered.

Nevada County.

Transcript, Jan. 30th: Messrs. Neece & West cleaned up from their cement claims, after a week's run, the sum of \$2,000. These claims are looking splendid. The cement claims in Little York township will soon give a good account of themselves.

The Scandinavian Co. have struck some splendid rock, and the ledge is 2 ft. 3 in. thick. They are taking out a large quantity of rock. It is the intention of the company to erect a fine mill in the spring.

Jan. 31st: The Cornish mine, on Deer creek, is yielding first-rate rock, and is paying well. The company are going to put in a new battery of six stamps, and fix up the machinery generally.

Frank Fisher has been engaged for some time in fixing up and overhauling the machinery for Palmer & Everingham's quartz mill, which is to be erected at Graniteville.

Grass Valley National, Jan. 30th: The New York Hill Co. commenced running their 10-stamp mill a week since, and finding it insufficient to work off the rock taken from the mine, are about adding 10 additional stamps. The rock continues to turn out as rich as heretofore, and in addition to the daily amount taken out, the company have 900 loads of rock on hand awaiting crushing facilities.

Jan. 31st: Pike Flat continues to pungle out specimens, Mr. A. Shurtliff being the lucky picker up of one of these worth-the-picking-up arrangements, on Tuesday last, worth \$40 in gold.

Feb. 3d: McCauley & Co's mill, at Boston Ravine, is engaged in crushing a large quantity of rock from the Spring Hill mine. The rock will come up to the general average of rock heretofore crushed from this mine.

The Inkerman Co. are at work prospecting, and have a whim for hoisting in operation. The character of this as a paying ledge will shortly be ascertained. Some handsome specimens have at times been taken from it.

Gazette, Jan. 29th: We were shown yesterday by Mr. Tisdale a lot of fine specimens of ore from the Banner mine, some of them containing free gold in abundance and others being rich in sulphurets. The most of the ore in the mine is of the sulphuret variety, in which the gold is not visible; but three separate shoots have been found, in which free gold is interspersed in seams through the rock. The work in this mine, which was partially suspended about the first of January, is again in full blast, and the new hoisting and pumping apparatus is working to perfection.

Feb. 3d: During the month of January, the New York Hill Co. raised 600 loads of rock, averaging a ton and one-fourth per load. The clean-up after the first three days' run of the new mill yielded \$1,600, while a considerable amount must have been taken up by the new machinery.

At the North Star mine, 1,200 tons of rock were hoisted from the mine from the 1st of January to the 1st of February, which is yielding an average of \$33 per ton.

The yield of the Empire mill, at Ophir Hill, at the clean-up of the middle of last month, was \$19,300.

Excelsior.—*Gazette*, Jan. 29th: D. A. Rich, who went to Meadow Lake two or three weeks ago to repair one of the dams of the South Yuba Co., arrived in town

yesterday, having returned by way of Cisco. He says the weather has been intensely cold in that region, and the snow is some 10 or 12 ft. deep on the level, but in some places has drifted to much greater depths. Only 30 or 40 persons are now stopping at Meadow Lake and vicinity, the remainder of the population having left, to spend the winter in a warmer climate.

Placer County.

Stars and Stripes, Jan. 30th: Quite a number of experienced miners from abroad are making their headquarters in Auburn and vicinity, and daily, when the weather is favorable, they may be seen with pick and shovel wending their way to the hills in search of quartz leads. The vicinity of Ophir, where the placer diggings were very rich, seems to be a favorite resort of prospectors.

Dutch Flat Enquirer, Feb. 1st: The miners' ditch at Gold Run, has reduced the price of water to the rates demanded by the Miners' Association of that place, that is, nine cents per inch for 10 hours and 15 cts. for 24 hours. Simultaneously with the reduction of the price of water, several companies have commenced work on their claims, and others are getting in readiness for work. Among the claims now at work are C. Carr and Sacks & Co. The prospects of the claims at the above place are represented as very flattering.

Sacramento County.

Folsom Telegraph, Feb. 1st: We heard of a wash up in a mining claim in this vicinity a short time since, from which \$4,000 was realized.

Shasta County.

Courier, Feb. 1st: The miners about Janesville, Roaring River and Arbuckle are said to be taking out more gold this winter than usual. Each mining season tends to establish the truthfulness of the theory that the mines on Cottonwood, about Janesville, are of a permanent character, such as will require years to work out or exhaust. It is the belief of many experienced miners that the branches of Cottonwood Creek will pay most of the way up to their source. From Janesville, to the head branches of Cottonwood is a distance of 40 to 50 miles, and the streams are lined with fine gravel bars and flats, some of which are known to contain gold, but have been but little prospected. All the streams putting down from the opposite side of Trinity Mountain have paid, or are now paying rich.

We are informed by several of the stockholders that the Horseshoe Bend Co. intend shortly to commence preparations for opening a claim on the ground drained by turning the waters of the Sacramento through the Horseshoe Bend tunnel.

Sierra County.

Downieville Messenger, Jan. 18th: The Goodyear's Bar correspondent gives the following casualties during the late storm. The high water has done considerable damage along the river to us miners. Craig & White lost their bridge across the river, carrying the flume from Goodyear's Creek to their claims. They intend building a wire bridge in the spring. The Goodyear's Bar Fluming Co. lost their bar and considerable of the flume. Wm. Thomas' Co. also lost most of their flume from the mouth of Rock Creek to Routadollar Bar, which cannot be repaired until spring.

The correspondent in Mohawk Valley writes: There has been but little mining done here since winter set in, although several companies are ready and waiting to take advantage of any fine weather when it does come. Sol. Babb and John Vann took out of Babb's Ravine, a few days before Christmas, \$225, one specimen weighing 11½ ozs. There are three other companies working in the same ravine, and are, no doubt, doing well.

Jan. 25th: The Gihsonville correspondent writes: The great abundance of water has enabled all who desired, to wash up their dirt. Claims, as a general thing, are paying fully as well as usual, while some are largely improving upon their former record. The Union claims are paying about an ounce per day to the band. They are working between 20 and 30 men.

Trinity County.

Journal, Jan. 25th: At Arkansas Dam, mining operations are almost completely suspended, as a result of the freezing term which preceded the last snow storm. Sheridan Bros. and Geo. Chapman were endeavoring to get work under way again when we passed there last Monday. The claims of Fisher & Co. across the river, are also idle from the same cause. At Evan's Bar work has been suspended. The high flume of McGovern & Co., which crosses the river a mile above, is loaded with tons of ice. The water had to be turned out over a week ago, the danger of its breaking being so great. Johnson & Timmerman are now opening a new claim on the high bench at the upper

end of the Bar. Lange's claim, on the opposite side of the river, is also frozen up.

More than usual activity, for the season, prevails about Junction City. Fegan has transferred his hydraulic to the hillside above the road and south of the old claim. Dacy Bros' claim, by the roadside, will be working shortly. On the opposite side of the river, Joe McKinney & Co. are tearing down Red Bank at a lively rate. It is one of the good claims. The Red Hill companies are all at work. We saw 30 ozs. of handsome dust which had just been taken from the claim of Mathews & Fecto, on Monday last.

Siskiyou County.

Yreka Union, Jan. 25th: All mining operations in the county have been suspended for several weeks on account of the severity of the weather.

ARIZONA.

Miner, Dec. 21st: The ravine recently discovered by England and Bridges, 11 miles from Prescott, continues to yield well. Judge Brooks recently panned out in one day \$5.

Noyes & Curtis are taking very rich rock out of the Chase lode, in Hassayampa district.

The Vulture mine, at Wickenburg, is now free from all incumbrances. The mortgages held upon it by Mr. Erwin Davis, of San Francisco, have been satisfied, and the Vulture Mining Co. are now the owners.

Dec. 25th: Miners at Walker's Camp are busily employed in working and taking out ore. N. A. French has worked another hatch of refuso Tie-Tie rock, which paid better than he expected. Fredericks, Marsh and Watson are taking rock from the Shamrock lode. Their team is constantly at work, bauling ore for the miners.

Workmen are now taking rock out of the Engenie, in Big Bug district. Work upon the Dividend is progressing, and the mill will be started soon. We presume the late rains caused the creeks to rise, and of course placer mining will commence.

Wickenburg & Smith, in Wickenburg district, will soon be ready to start up their mill.

The 20-stamp mill of the Vulture Co. is turning out piles of gold. Mr. Phelps, who purchased the claim owned by the V. M. Co., from Mr. Wickenburg, has returned to Arizona, and is now stopping at the mill.

Work on the Chase lode in Hassayampa district is being steadily prosecuted. One of the shafts is now down about 60 ft., and the rock taken out of it is excellent. Messrs. Noyes & Curtis are in high spirits, and believe they have struck it at last.

Wm. C. Reed has again commenced work on the Sterling mine. He will first try a lot of tailings which are supposed to contain considerable gold. The engineers and carpenters are now at work, getting the mill in order, and as soon as he works the tailings, he will put miners to work getting out ore. Mr. Reed has tried this mine before, and from some cause, did not succeed in saving the gold. Since that time he has been to California, examined the various processes used in that State to work sulphuret ores, tested Sterling ore himself, and had others test it for him to his complete satisfaction. He had 40 lbs. of it ground in a Varney pan, which yielded \$9.46, which would make the yield per ton, \$473.

Messrs. Roddick & Young are making things boil over in the Hassayampa district. Roddick presented us with a beautiful specimen of silver rock taken out of their lode—the Chance—at a depth of 44 ft. The pay rock is two ft. in width; the rock is the most beautiful we have ever seen, and contains plenty of silver. One of them panned 11 ozs. of silver and gold out of a panful of decomposed and crushed rock the other evening. Since writing the above, the boys have panned out over 21 ounces more.

Mr. A. O. Noyes intends to move his mill from its present location on the Hassayampa, up that creek, to some convenient point near the Chase lode.

At a miners' meeting held at La Paz, Dec. 16th, the boundaries of the La Paz district were fixed, and it was resolved that titles to mining claims shall be good until all Indian difficulties cease in the district, or for the term of 12 months from date.

COLORADO.

Central City Register, Jan. 4th: Geo. R. Mitchell has recently bought and moved on to the North Star property (Illinois lode) the large engine, tanks, etc., held by Capt. Tyler for indebtedness of the defunct Continental Co.

Mr. Blackman, of Mill City, recently exhibited to us some very rich specimens of silver ore from the Comet, a lode discovered last summer on the mountain above the Young America. Work is progressing favorably at Mill City. Mr. Hawkins is pushing forward his tunnel, ditto Mr. Brown of the Lincoln Co.

The Piasa Co. are fast completing their mill. New lodes, chiefly silver bearing, are being discovered occasionally on both sides of the creek in the vicinity.

Messrs. Loomis & Williams have leased the Cowenhaven claim on the Bates, and Mr. Miley is going to crush for them with the University Co's mill. The Chicago mill has been shut down. It was not in condition to run; not well built in the start, and not enough rock in the country to feed it and make it pay. A gentleman from Nevada informs us that 60 tons of quartz per day are now being mined in that vicinity, most of which is taken to Black Hawk for reduction. Mr. Conlee has engaged 20 stamps of the Black Hawk Co's mill, with a view of furnishing 40 more.

Georgetown *Miner*, Jan. 16th: The Hunkadora lode is again widening out. In September upwards of five tons of the ore was taken to mill for reduction, and since then 10 tons full width of crevice, including gouge, iron cap, etc. From the latter, Garrott, Martino & Co. run 4½ tons, of which the assay was \$76.92, of which they saved 82 per cent., or \$63.08 per ton.

Work on the Fulton lode is being actively prosecuted.

The weather still continues too cold for Garrott, Martino & Co. to start up their works.

Messrs. Hedges & Irwin are still working the Equator No. 2. The vein is improving, with indications of rich mineral in the bottom of the shaft.

Work on the Munsell lode is being actively pushed, and the vein is improving as the shaft deepens.

John T. Harris has laid upon our table a fine specimen of argenteiferous galena and sulphuret of silver ore, carrying blue and green carbonates of copper, from a new discovery on Sherman mountain.

Gen. Marshall is still actively working the Compass and Square lode.

Donvor *News*, Jan. 15th: We wereshown four bars of bullion at the branch mint this morning, valued at \$5,942.10.

The *Herald* says: The Sonora Co., in West Argentine, Clear Creek county, has shut down for the winter, on account of cold weather. On the Ayres lode, a tunnel has been driven 180 ft. This lode yields ore which assays as high as \$600 and \$800 per ton. The Mountain Man Co. are about to begin developing their property near the head of Virginia Cañon. A shaft house will be put up, and the work pushed forward with vigor. Dick Simons, of Georgetown, has struck a very rich lode on Sherman mountain.

DACOTAH.

Virginia *Enterprise*, Jan. 28th: It is quite certain that a large number of prospectors will leave this State early next spring for the Sweetwater mines.

IDAHO.

Boise *World*, Jan. 18th: Parties lately in from Deadwood Basin report that the mining season will open there on an extensive scale, and that 300 men will be required to labor in the diggings and in the ditches.

Owyhee *Avanture*, Jan. 25th: Mr. Skinner, who has just returned from Willow Creek, has shown us some of the gold. It is fine and bright, and probably worth between \$17 and \$18 per oz. Mr. S. is of the opinion that next season, while water lasts, the placers will pay good wages. The gold appears to be evenly diffused throughout the gravel from the surface downwards. No work is being done this winter, except getting out lumber for sluice boxes, etc., ready for use in the spring.

Mr. Sandburn, one of the purchasers of the Rising Star mine in Flint district, arrived in town this week from San Francisco. He was accompanied by a Mr. Smith, from Virginia, who is to be foreman. They will commence immediate sinking on the mine, and putting it in proper shape for working. It is the intention of the parties to erect a large mill as early as the season will permit.

MONTANA.

Post, Jan. 18th: The Bannack correspondent writes: Col. N. E. Wood is still successfully operating with his astral mill. The quartz from the Cherokee paid from \$250 to \$465 per cord, averaging about \$400 per day for the mill. He is now crushing rock from the St. Paul, with equal success. Mr. Geo. Brown is furnishing the quartz, and has large amounts ready, and can take out any amount. Mr. Harry King is also sinking on the same lead, and has struck upon a vein of most splendid quartz. Mr. Samuel Jagers is also sinking on a new section of the same lead. Mr. Herman Clark is driving ahead the tunnel to the Mademoiselle. Sears & Wright are sinking a shaft on the Fowler at Ball Mountain. Beside these, there is a large number of men

drifting in the Marysville Bar, in the bed of the creek, and in various other bars, and all have struck good pay. Some, indeed, have rich ground and will make their fortunes. Dr. Weston and Clark Smith have just got an arastrum at work on their big lead, on Black Tail Deer Creek, and are hopeful of success. Messrs. Clark, Kirby and McFarlan are developing their property on Birch Creek, and will erect a furnace there next summer.

The I. X. L. Co. had a fine brick of 204 ozs. turned out for them on Saturday. It was the result of a partial clean up from a run of six days of their 24-stamp mill, on ore from their ground on the Union No. 2 lode. Turnley's 10-stamp mill turned out 76 ozs. of nice retort from a run of six days on the Park lode.

NEVADA.

Black Rock.

Unionville *Register*, Jan. 25th: Uncle John Atchison passed through town one day this week, on his way to Black Rock, determined to give it one more trial. He was not, however, sanguine of success, yet believed his faith at least equal to a grain of mustard seed.

Esmeralda.

Virginia *Enterprise*, Jan. 28th: Mr. T. W. Abrahams yesterday arrived in this city from Pino Grove. He exhibited to us some fine specimens of ore from the Wilson mine, taken out near the Midas line, that were full of bright spangles of free gold. He brought with him 111½ ozs. of bullion from that portion of the Wilson mine upon which Toombs & Co. have a contract. This bullion is the product of about 40 tons of ore worked at Crosman's arastrum mill. The bullion was melted into a bar by E. Rulling & Co., assayers in this city, and was found to be worth \$1,981.69, or nearly \$50 per ton. Wilson's new 10-stamp mill started up about a week ago, and a clean-up will soon be made. Messrs. Toombs & Abrahams will shortly erect a 5-stamp mill, which they will procure in Washington district and remove to Pine Grove. The Wilson, Midas, Ophir, Wheeler and Cadmus mines are being vigorously worked, and are all looking better than at any previous time in their history. Pine Grove bids fair to become one of the best mining districts in the State outside of Virginia and Gold Hill districts. There will soon be half a dozen mines making regular shipments of gold bullion from that section.

Humboldt.

The Oreana correspondent of the Unionville *Register* of Jan. 25th says that the Montezuma smelting furnace has been in constant operation for over four months, reducing 1,300 tons of ore. The mine is developing to the utmost satisfaction. The lower levels now being run carry a ledge of solid ore 8 ft. in thickness.

Reese River.

Reveille, Jan. 24th: Yesterday nearly 4,000 ozs. of crude bullion were brought into the city from Rigby's mill at San Antonio. A lot of about 3,000 ozs. was sent here from the mill on the 8th inst. The bullion produced at the mill is obtained from the ore of the Liberty mine.

Jan. 25th: From W. B. C. Harker, who has just arrived from Silver Peak and Red Mountain districts, we learn that the operations of the Silver Peak and Red Mountain Co. are progressing finely. The mill will be finished in April, and will present many features of great excellence. Only the gold-bearing ledges of the company, situated in Red Mountain, are at present producing ore; the rich silver veins of Silver Peak are lying idle.

Jan. 27th: We learned through a private letter that for several days the weather has been very cold at Hot Creek, and had temporarily stopped the Old Dominion mill. The Merrimac and Old Dominion mines of the company were looking uncommonly well, and it was expected that the latter ledge would be struck in the tunnel a short distance further.

The Austin correspondent of the Virginia *Enterprise* of Feb. 2d, says: A 40-stamp mill is being built in Silver Peak district by the Great Salt Basin Co. for the reduction of gold-bearing ore from the Red Mountain mine. The mine is known to be of great value, thousands of tons of ore being available on the surface which will pay \$30 to \$40 per ton. The metal is free, flour-gold, not visible in the ore, but always giving a good "prospect." Gen. A. L. Page, who has recently returned from the East, is about to repair the Keystone mill, and as soon as salt can be got, he intends to reduce ores at \$35 per ton. Few mining regions produce such masses of ruby ore as can be seen at any of the best mines on Lander Hill. A stranger looking at a slab of ruby silver would wonder what kind of a mineral substance it was. He would admit that it was very compact and

heavy, of a beautiful crimson color; but he could scarcely think a ton of it would contain a thousand dollars of bright marketable silver. From the North Star mine a ton could be easily assorted out at any time which would go far over this figure. A conditional sale has been made to an Eastern company of the Northern Bello and two other lodes in Columbus district, and a mill will be built in the course of the summer. There is a large quantity of pay ore near the surface in this mine, the assay value of which, as proved by 25 tons worked at the Knickerbocker mill, in Union district, being \$120 per ton. The mill of the Centenary Co. at Newark has been doing excellent work for some time past, the daily yield of bullion being over \$1,000. The ore from the stopes yields \$100 per ton, and 12 men out of the 28 employed in the mine can take out enough to keep the mill in steady work. The ledge is 8 ft. wide in the lower winze, and carries a good quality of ore. From want of salt, the mill will have to be closed at the end of this week, and it will probably be in April or May before a supply can be obtained.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia *Enterprise*, Jan. 28th: Work has been commenced on the croppings of the Yellow Jacket mine, and the ore is to be taken to the dump through the Yolo Co's tunnel.

Having received their new spur-wheel, the Imperial-Empire are again at work upon their shaft. The main shaft is filled to the depth of 320 ft. with water. They will soon drain the shaft, when drifting will be commenced.

Jan. 29th: A portion of the machinery for the new Ophir pump arrived in this city yesterday. We presume that the remainder will soon follow, and that the whole will soon be set up, when work will be resumed upon the company's new shaft—now 165 ft. in depth.

Jan. 30th: Since the favorable results of the workings of the Lady Bryan croppings have become generally known, many abandoned mines in Flowery and adjacent districts are attracting attention. Next summer the croppings of many old mines in that section, as the Monte Cristo, Cherokee, Buckeye, Josephine, etc., will doubtless be worked.

Feb. 1st: Wells, Fargo & Co. shipped from their office in this city, during the past week, 2,272 lbs. of assayed bullion, valued at \$32,717.63.

Gold Hill *News*, Jan. 27th: Work on the new Ophir shaft has been discontinued, and will not be resumed until the new pump is placed in position.

The Dayton Silver M. Co., in Devil's Gate district, have levied an assessment of \$1 per share on its capital stock, payable on or before the 28th of February next. The company is arranging to develop their mine.

NEW MEXICO.

A correspondent of the Denver (Col.) *News* of Jan. 15th, writing from the Cimarron mines, says: Mr. Robinson, well known in this Territory, with four others, took out from a space not larger than ten square yards, up to Nov. 20th, 1867, \$55,000. Willow Gulch, at the head of which this prospect was taken out, is five miles long, and has been well supplied with water, from Willow Creek, which has never yet failed. On this gulch there are 17 companies, who have opened their claims. The Idaho Co. found the bedrock at eight ft., and the dirt paid 35 cents to the pan. The Union Co. took out \$1 to the pan. Anther & Co. have a claim, 16 ft. down to bedrock, where the pay dirt is eight ft. thick, and which yielded \$1.75 to the pan. Col. Henderson opened another claim eight ft. down to bedrock, and got 25 cents to the pan. At Beniles Willow, there are seven other rich gulches already discovered, which prospect well, but in some the water is scarce, soon to be supplied from a ditch now being constructed. Thos. Pollock has discovered a new gulch near Spanish Bar, which prospects 25 cents to the pan on the surface. The extent of the discoveries are over 25 miles. Gen. Hooper, of Colorado City, is now in these mines, and states that there are 1,000 miners there, and all appear satisfied with the prospects. Instead of but one lode of gold or silver discovered, there has been over 100 already found, which prospect free gold, free from sulphurets. One belonging to Paige & Co., has been sunk 20 ft., and the crevice shows five ft. The gold is readily seen with the naked eye, and prospects 50 cents to the pound of rock. Five miles from Willow Gulch, a large hill has been discovered, which appears to be all quartz. Three lodes which prospect well for silver, have been found. One copper

lode shows two ft. crevice on surface, and yields 41 per cent. of pure copper.

On the other hand, we have the following report from another correspondent in the same paper: "I have understood that some one has written to some paper in Denver, about large prospects of gold here. The best prospect I have seen, was no more than 15 cents to the pan. Most of the claims pay from one to two cents to the pan. Water is scarce. Several lodes of gold and one of silver have been discovered."

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. KNOX, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1868.
Mr. C. T. RANNEY is our duly authorized agent for Sacramento County. Nov. 29, 1867.Dr. L. G. TATES is our duly authorized traveling agent for this paper. July 15, 1867.
Mr. A. B. BUTLER is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. H. C. NORTHROP, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

OUR NEW YORK AGENT, Mr. M. A. LATHEP, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No 725 Broadway, for the present. Nov. 26, 1867.

San Francisco:

Saturday Morning, Feb. 8, 1868.

Notices to Correspondents.

F. A. Marysville.—We suspect that the non-malleability of the gold alloy you allude to is in consequence of the presence of a very minute quantity of lead, antimony or tin, which metals were probably derived from the solder employed in the gold rings you name. The lead and antimony would most probably become dissipated within a moderate time from the period of fusion; tin especially, if in the form of oxide, as some would be sure to become, would not dissipate so readily. If such is the fault, a little finely-powdered flint glass, niter and borax, added to the alloy, would form a slag that would absorb all the metals named. If niter, however, is used, the copper should not be added until afterwards. The case you state respecting the rolled plates formed from gold coin being malleable, but that on re-melting the "cuttings" from these plates, without any other addition of any kind, it is found impossible to procure a malleable result, we are unable to account for, unless in the course of hammering or rolling, the golden plate has been laid and pressed upon a leaden sheet or block. If the brittleness has arisen from the oxidation of the copper present, as might sometimes occur, the remedy would be to throw into the crucible a little pounded charcoal, or to stir the fused metal with a piece of wood, such as a dried willow switch. We would like to hear from you, with any further particulars, after the above has been received. One-quarter of a grain of antimony, tin or lead, or an equal weight of these metals combined, would suffice, if present, to render the amount of gold you name quite brittle.

GRAMMATICUS.—The oldest mode of spelling oxide was with the letter *y* in place of *i*. We believe it was Sir Humphrey Davy, who, during the early part of the present century, introduced the mode of spelling this word with an *i*. The recent change in the manner of spelling this word is only a resumption of the original, and more proper orthography. The word has a Greek derivation, viz. *oxis*, signifying sharp or acid. Many alchemical and ancient pharmaceutical preparations possessed the prefix *oxy*, as a specimen of which we may give for an example the word *oxymrhodine*, a mixture of two parts of oil of roses with one of vinegar of roses. The only ancient word of the class still in use (and that principally among druggists) is the word *oxymel*; acid or vinegar combined with honey. We agree with you in condemning the practice, now becoming common, of using the terms *oxyd*, *chlorid*, *iodid*, etc.; the *e* final should always be employed in such cases, both for euphony and grammatical correctness. It was the French nomenclaturists who first employed the word *oxygen*, to denote the gas with which we are now so well acquainted. The derivation is appropriate, being from the Greek words signifying acid, and to generate. At the time the word was adopted, oxygen was deemed to be the only acidifying element; hydrogen is now known to possess the same property.

Mr. SEWARD is talked of as Minister to England, in place of Charles Francis Adams, whose private business compels him to return.

Belting and Lacing.

SOMETHING NEW AND USEFUL.

There has always existed more or less complaint among millmen about belting and belt-lacing. The trouble with regard to the belting is not due so much to the workmanship of the belt maker, as to the leather of which the belts are made. Belt leather, although it may be quite strong when new, is frequently found to lose its strength and pliability by age. It becomes hard and brittle—*stale*, as the tanners call it.

The leather of which the best heavy belts are made is the same as that which is used for the soles of boots and shoes, with the only difference that when it is to be used for belts, it is oiled, but when it is to be worked up by the shoemaker it is compressed (rolled). The principal feature in the formation of leather consists in so chemically combining certain substances with the gelatinous compound which composes the skins of animals as to prevent it from undergoing such putrefactive change as would destroy its fibrous consistency. To accomplish this purpose, tannic acid is employed, either as an extract or in its various vegetable combinations, chief of which is the bark of certain species of the oak.

A lime, or some other depilatory process, is always used as preliminary to the tanning proper. Whatever process is employed for this purpose is more or less destructive to the hide. This is especially apparent whenever leather is put to a task where its power of tension is more particularly required. The lime cannot be entirely removed, and just to the extent in which it remains it is injurious to the leather. Most leather is subjected to a still further process, injurious to its tensile strength, but employed for the purpose of giving it a soft, spongy appearance—a condition under which it works more beautifully for covering or sinking the thread, as in sewing. This process is technically called *plumping*, or swelling, and consists in submitting it to a weak acid bath.

Good sole leather should remain solid when thoroughly soaked in water, to the end that it may preserve the boot or shoe in proper shape. It is desirable that sole leather should resist compression; and the more thorough the ordinary process of tanning, the better it answers this requirement. With harness leather, it is different, as harness works under other conditions. Durability, pliability and strength are the chief qualities benefiting the consumer. The manufacturer likes the leather rather well limed and spongy, because such leather as we have already intimated is easier sewed, the thread can with less exertion be sunk beneath the surface, and the various parts can also be more nicely shaped and finished to please the eye. Buyers are not judges.

The desirable qualities of good belt leather are, first and foremost, great longitudinal strength and pliability. There are but few belts where other qualities than these are desirable. Belts running on cone pulleys, or half-twisted belts which have to be kept on by a flange, are exceptions. It is not necessary for a belt to be thick, if thickness does not give strength. Lime and oak bark are the cheapest agents for the manufacture of leather; but they are not the best—at least not for belt leather or lacing. For such purposes they deprive the leather of its most desirable qualities—tensile strength and pliability—and gives it one which is not required at all, namely, the capacity to remain firm when fairly soaked in water. This is desirable in the sole of a boot or shoe. A leather belt is only expected to stand accidental moistening, and not be spoiled by a thorough soaking.

All over Russia, Poland, and some adjoining countries, there is a kind of leather used for harness, which, in point of usefulness and durability, is not equaled by any in the world. Although there is an abundance of good oak-tanned leather, farmers there scorn the idea of using such for harness. The leather which they prefer they prepare themselves, without lime or tanning; fish oil only is used. The preparation is similar to Indian tanning, but the leather so prepared is much harder. It is mechanical tanning exclusively. All chemi-

cal preparations and reactions are carefully avoided.

The great drawback to this kind of leather has heretofore been the cost of its preparation—a large amount of hand labor being involved. There exists in this city, however, an establishment where, by means of a machine, which has recently been patented through this office, the mechanical process of tanning has been so reduced in cost as to bring this superior leather within the reach of all. There are numerous belts made after this process now running in different mills and factories in this vicinity, which have been shown, by actual use, to be altogether superior to the best chemically-tanned belts. They do not stretch, and are of superior strength and pliability, and are no more changed by age than is common dry rawhide, when kept constantly free from moisture.

For double-belting, this leather possesses those qualities so much sought for, but not to be met with in common belt leather; viz: continuous strength and pliability.

As for lacing, the deficiency is owing partly to the fact that cheap inferior hides are used, and also to the mode of tanning. All lace leather generally used in this country contains salt and alum (readily detected by the tongue), and loses its strength rapidly when in use or lying about. But lace-leather often becomes unfit for use while on the way from the place of manufacture. The lace-leather, as manufactured in the establishment above referred to, differs from the other in the following respects: it is not artificially thickened; it does not stretch; is not affected by either dry or damp atmospheres, and never loses its strength. The manufactory above alluded to is situated at 435 Brannan street. See advertisement in another column.

FORESTS AND RAIN.—It is said that in certain parts of Egypt where many trees have been planted they are beginning to have a little rain. It is generally conceded that a country will produce more food when one-fourth of the ground is covered with forest, than when the whole is cultivated. All forest or all open plain is unfavorable to rain. A reasonable distribution of forest and plain is the most desirable condition for man, and the one best adapted for health. There is much probability that a judicious planting of forest trees throughout our California valleys, which would soon become valuable for timber and fuel, and the partial clearing of our mountain forests, which is already in rapid progress, would materially affect our summer rainfall. It is well known that the cutting away of the redwoods along our Coast Range is sensibly decreasing the productiveness of the neighboring valleys. The existence of the redwood forests benefits the land in two ways; by their shade they greatly retard evaporation, allowing the moisture in the earth to find its way downward to feed distant springs and rivulets, while their heavy foliage acts as a most important condensing agent, in conducting the moisture of the prevalent coast fogs to the earth. None who are familiar with our redwood forests can have failed to notice this last fact. So rapidly is condensation effected by the redwoods during a heavy fog, that a person will be wet through in a few minutes by the dripping from the trees, while he may travel perfectly dry all day in the same fog in the open country. The destruction of the redwoods of California will prove a greater calamity in the way alluded to, than in the scarcity of timber which will thereby be produced.

THE CENTRAL PACIFIC RAILROAD.—The progress of the Central Pacific Railroad on the Eastern slope is progressing with much extraordinary energy. Sufficient motive power and material for track-laying are now in transit to complete the track 100 miles eastward from the Summit by the time the season will allow of the closing up of the gap between the Summit and Cold Creek. It is expected that the cars will be running from Sacramento City to the Humboldt river by the first of August next. Over 100 gangs of Chinamen, in companies of 30 each, with white overseers, are now at work on the Eastern slope, below the snow line. The present favorable weather is being fully improved.

The Mining Academies of Saxony and Hungary.

After enumerating some of the advantages which Freiberg possesses as a locality for a Mining School, the writer of this paper proceeds to give some account of

THE MINING SCHOOL AT SCHEMNITZ.

The Academy of Schemnitz was founded during the reign of the Empress Maria Theresa, about the year 1760, for the purpose of educating officers to superintend the mining and smelting works throughout the whole of the Austrian dominions. The extent of the provinces composing the monarchy, and the low state of education in the more distant portions, made it very necessary to place under the direction of well-instructed men the management of departments so various as metalliferous mines, salt works, collieries, iron works, smelting furnaces, and forests, all of which are in some places in the hands of the Crown. The number of students has of late years considerably increased, and comprises not only those who seek for government employment, but also many who are sent by individuals, or by mining companies to pass through the whole routine of study, or to attend only some particular courses, according to the nature of the operations which it is intended they should conduct.

The institution has been endowed with great liberality; for not only are the professors paid by the government, but such a sum is yearly granted for the expenses of the well-ordered laboratory, and for other experimental purposes, that the students obtain gratuitously an excellent education. To obtain admission, subjects of the Emperor must be able to produce certificates of having passed good examinations at their schools, and also a recommendation from one of the *Hofrathe* or Aulic councillors, whilst the same advantages are open to foreigners provided with a suitable introduction through the ambassador, or some known person in their own government.

The system of education must be followed out equally by all during the first year, after which a certain number who are allowed to pass aside to the *Forstwesen*, or forest department, are freed from a great portion of the after studies, whilst it is left to the choice of the rest to pursue voluntarily that branch in addition to the regular routine. The subjects are divided as follows:

First year—1st half.—Elementary Mathematics, consisting of Geometry and Algebra; Plane and Spherical Trigonometry; Conic Sections; Plan-drawing. Second half.—Natural Philosophy (*Physik*) and Mechanics; Descriptive Geometry and Stereometric Drawing; Crystallography.

Second year—1st half.—Chemistry; Mineralogy; Metallurgy (*Huttenkunde*). Second half.—Geognosy.

The Foresters' course is Botany, Practical Geometry, etc.

Third year—1st half.—Subterranean Surveying (*Markscheidekunst*); Machinery and Drawing; Double Book-keeping; Botanical Abstract (on timber, etc.). 2d half.—Art of Mining (*Bergbaukunde*); Dressing of Ores (*Aufbereitung*); Architecture, or General Building.

The Foresters are exercised in valuing standing timber, etc.

Fourth year—Practical exercises (*Vervendung*).—Surveying, common and subterranean, four months; Mining, one month; Dressing and washing of Ores, one month; Smelting furnaces, two months.

During the third year, the young men are required on one day in every week to go through a portion of some mine, to examine minutely every particular, and to hand in a written report upon it to their professor. A few of them even take a piece of work on bargain which assists to pay their expenses, whilst it gives them a practical acquaintance with sinking and driving.

The half-yearly examinations are conducted (notwithstanding that which some travellers may have stated to the contrary) with great strictness, and quite openly; and according to their result, the students are divided into those who gain preference (*Vorzug*), 1st class and 2d class; those who have the misfortune of being placed in the latter (*ein zweiter Kreigen*) being obliged to undergo a second trial. The *Oberstkammergraff*, or supreme count of all the works in the district of Lower Hungary, also directs the academy, and in conjunction with the professors, assists on these occasions. The questions are written on small slips of paper, and two or three of them are taken up at hazard by each in turn as he is called upon in alphabetical order, and are answered *vice voce*. The most successful candidates receive as a reward a species of exhibition, sufficient to defray a great portion of their expenses, whilst those who have more than twice been returned in the sec-

and class, must relinquish all claim to government employ. The number of students at this school generally averages from three to four hundred.

When the practical course has been brought to a conclusion, the passed students are draughted off to different places, and into the various branches, to serve for four, six, or even more years of probation upon a small pay, as *Praktikanten*, after which, as vacancies occur, they receive the appointments for which they have been preparing.

The usual expenditure of the students is small, varying from 20*l.* to 60*l.* a year; the underground mining suit is their usual dress, though a neat uniform is worn on great occasions; a remarkable degree of harmony and good feeling prevails amongst them, and the duels so common in German universities, are here unknown.

DEFECTS POINTED OUT.

In looking at the system pursued at the above institutions, we find at both of them a prominent defect tending to impair the usefulness of the class of men which they produce, viz., that the time is so short in which the scholars are expected to pay attention to such a multitude of subjects, that it is impossible they can acquire all of them soundly and practically; and although an excellent foundation may have been laid, it must be left entirely to after years to rear up the superstructure, when amid the pressure of business, and other cares and pursuits, there is only a small percentage of men who feel an inclination to return to a system of study. The mode of partially obviating this evil, would be to separate more decidedly the departments of the mine and the smelting furnace; for although a portion of the earlier studies is necessary as a preparatory course for both, most of what follows cannot be obtained but at a great expenditure of time and labor; and in the ordinary routine it is as foreign to the business of the metallurgist to construct the timbering of a shaft, as to that of the miner to build a blast furnace. There are some cases, it is true, where works are to be conducted in an uncivilized country, when an extended knowledge must be highly desirable; but for these a fuller course of preparation is clearly necessary.

To Freiberg this remark is not so applicable as to Schemnitz, since in the former the two classes are kept more distinct; and it is probably to this source that we may trace the improvements—more particularly in metallurgy, which emanate from the Saxon Academy. In Austria it has been too common to pass men from one department to the other, as if skill in the one point must necessarily indicate a good acquaintance with another; upon the same principle which, ere now, has elevated a good carman on the Golden Horn from his humble *cayeeek* to the command of an army. On the other hand, I cannot but bear witness that the pupils of the Hungarian Academy, when full scope is given to them in the department which they have chiefly pursued, yield to none in the science and practical skill which they bring to bear on their object, as evinced particularly in some of their silver furnaces, in the water-pressure engines of Mr. Adriary, and the improved dressing works lately erected on a large scale by Mr. Rittengen, under the direction of the Oberstkammergraf von Svaizer.

For want of space, we condense the remainder as follows:

The system adopted at each of these places is the one best adapted for the lodes of each. At Freiberg, these are from two to six feet in width, the rock hard gneiss, and the surface slightly undulating; while at Schemnitz the lodes are fifty to two hundred feet wide, the rock greenstone porphyry, often softened by decomposition, and the surface rough. The plans for tunneling, shafting and timbering, must therefore be entirely different in the two places.

Notwithstanding these educational advantages, the scientific character of Austrian mining is lower than it once was, and lower than it should be. Science has been too much neglected for practice, and in consequence the advance made in other districts ignored. The Schemnitz student goes to his distant charge unprepared for a state of things unlike that to which he has been accustomed. The very object of such an institution is thus lost sight of.

So little advance had been made in 1841, that the Professor of Geology delivered as lectures the notes, unaltered, which he made half a century ago under Werner!

The course fails, then, as regards the teaching of general principles,—a most essential point. It need not, therefore, excite surprise that serious blunders should often be committed. It has been expected that a complete change will be made in the Schemnitz Academy. It has been pro-

posed by some that the preparatory studies be pursued in Vienna, and the various processes afterwards observed and practiced in the mining district.

A GOOD DEAL "LESS THAN NO TIME."

It seems strange, even in this age of wonders, to hear one say that a telegraphic dispatch sent from Valencia, Ireland, to San Francisco, 7,845 miles, in February, was received some time in January! Yet it is even so. On the 31st ult., at 10:40 P. M., the San Francisco office received a greeting from Valencia, dated February 1st, 6:54 A. M. It was, therefore, eight hours and fourteen minutes ahead of time. An answer was promptly returned from San Francisco. Both messages were repeated at Hoar's Content, N. F. After this little interchange of compliments, the San Francisco operator, to show what could be done, sent seventy-seven words to Hoar's Content in less than three minutes. The distance is about six thousand miles. Ninety-nine words were sent to New York in three minutes.

This is the longest working ever made. In our issue of January 25th, we spoke of the circuit of some 4,200 miles between Houston, Texas, and Salt Lake City, via New York, which was worked in December last, as the longest up to that time. That feat is now hardly worth mentioning. The cable might have been included in the single stretch, but for the difference in instruments. We append a memorandum, showing the difference in time between the several points, as shown by this experiment:

<i>February 1st.</i>	<i>January 31st.</i>	<i>Diff.</i>
Valencia..... 6:54 A. M.	San Fran.....10:40 P. M.	8:14
Heart's Content...3:10 A. M.	San Fran.....10:33 P. M.	4:37
New York.....1:40 A. M.	San Fran.....10:22 P. M.	3:13

MECHANICS' INSTITUTE.—The annual meeting of the members of this Association was held on Thursday evening. The great interest taken in the preliminary affairs of the proposed Industrial Exhibition was shown by an unusually large attendance of members, some 300 being present. After listening to the reports of the Treasurer, and the Committee on Finance, Building, Books, etc., it was voted to proceed to an election by ballot, of a committee of five to present nominations for officers to be elected for the ensuing year. The result of the election was as follows:

H. F. Williams, 113 votes; James Laidley, 111; P. Goughran, 101; Gardner Elliott, 113; George Cofran, 110; W. B. Ewer, 150; C. R. Steiger, 158; N. W. Spaulding, 157; A. S. Hallidie, 152; C. F. Bassett, 150; N. D. Arnott, 6; W. J. Lewis, 6; I. N. Scott, 4.

Messrs. Ewer, Steiger, Spaulding, Hallidie and Bassett were declared duly elected.

It was moved that the Committee publish the names of nominees within ten days, which was carried.

The following resolution was adopted: *Resolved*, That the Mechanics' Institute of the city of San Francisco now declare in favor of the eight-hour system, and respectfully recommend to the Congress of the United States and the State Legislature the passage of laws making eight hours a legal day's work.

The receipts of the Institute for the past year have been \$32,209; expenditures, \$31,461; books added to the library, 1,295.

THE GEOLOGICAL SURVEY.—A bill has been introduced making an appropriation of \$65,000 for continuing the State Geological Survey for the next three years. The State owes it to her good name, as well as to her most important industrial interests, that this bill should pass at once. There should be no pecuniary delay or hindrance in the way of this work.

An apparatus for effecting a continuous method of aspiration has been devised for accelerating the healing of great amputations. The chief cause of danger is thereby materially lessened.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 303 Montgomery street, corner of Pine, San Francisco. 2v15

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 26v15-3m

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-alm

Accidents.

The Traveler's Insurance Company, of Hartford, Ct. insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required. WM. MACDONALD & CO., Gen'l Agents, 121 Montgomery st., San Francisco, Opposite Occidental Hotel. 2v16-3m

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag, and Crop Presses, Colling Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS.—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tub, Prater's concentrators, Wakle's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Strakht, Batteries, for wood or Iron Frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

5v13v

UTILIZATION OF WOOLEN BAGS.—Shoddy, a much belied article, being really a very important article, is, as is well known, formed from woollen rags reduced to fine shreds, and worked up again in combination, in greater or less proportion with the wool. The inferiority of the unmanipulated staple results from the methods heretofore employed for disintegrating the rags, which are reduced in large part to mere powder. A process has, however, recently been patented, by which the old fabric is first separated into threads, which are then torn apart by means of peculiar hooks, so that the fiber is not broken or damaged, and may be worked over almost as well as new.

FIRE RECORD.—The following is a recapitulation of the losses by fire which occurred in the United States during the past twelve years:

Total losses in 1856	\$21,150,000
Do. 1857	16,792,000
Do. 1858	11,561,400
Do. 1859	16,553,000
Do. 1860	15,597,000
Do. 1861	18,020,000
Do. 1862	17,690,000
Do. 1863	14,000,000
Do. 1864	22,522,000
Do. 1865	43,139,000
Do. 1866	66,410,000
Do. 1867	36,945,000

Total losses in twelve years.....\$304,854,000

PETROLEUM EXPORTS.—The quantity of petroleum exported from New York in 1867 was 33,431,778 gallons. In 1866 the quantity exported was 33,992,394 gallons. Decrease in 1867—560,616.

The quantity of petroleum exported from Philadelphia to foreign ports in 1867 exhibit an increase over the exports in 1866 of 1,915,357 gallons.

At a recent sale in Georgia, a cotton gin sold for fifty cents and plows for five cents each. Many farms are being sold for small indebtedness, and there is a fair prospect of the universal bankruptcy of the South, unless the stay-law can be restored.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MARKED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.

Hamburg, by Hamburg mail—2 cents each.

Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.

Lunenbourg, by Bremen mail—3 cents each.

Lunenbourg, by Hamburg mail—3 cents each and 1 cent per 1/2 ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1/2 ounce.

Sweden, by Bremen or Hamburg—3 cents each, and 1 1/2 cents per 1/2 ounce.

Norway, by Bremen or Hamburg—3 cents each, and 1 1/2 cents per 1/2 ounce.

Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce.

Switzerland, by Bremen or Hamburg—4 cents each.

Italy, by Bremen or Hamburg—5 cents each.

Turkey, by Bremen or Hamburg—3 cents each, and 5 1/2 cents per 1/2 ounce.

Greece, by Bremen or Hamburg—3 cents each, and 5 1/2 cents per 1/2 ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 5 1/2 cents per 1/2 ounce.

Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1/2 ounce.

Austria, India and China, by Bremen and Hamburg mails, via Trieste—8 cents each, and 2 cents per 1/2 ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.

Hamburg, by Hamburg mail—1 cent per ounce.

Prussia, Austria and German States, by Bremen or Hamburg—1 1/2 cent per ounce.

Lunenbourg, by Bremen mail—1 1/2 cent per ounce.

Lunenbourg, by Hamburg mail—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg—1 1/2 cent per ounce and 1 1/2 cent per 1/2 ounce.

Sweden, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.

Norway, by Bremen or Hamburg—1 1/2 cent per ounce, and 4 cents per 1/2 ounce.

Holland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce.

Russia, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce.

Switzerland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 cent per 1/2 ounce.

Italy, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce.

Turkey, by Bremen or Hamburg—1 1/2 cent per ounce, and 5 1/2 cents per 1/2 ounce.

Greece, by Bremen or Hamburg—1 1/2 cent per ounce, and 5 1/2 cents per 1/2 ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 1/2 cents per 1/2 ounce.

Austria, India and China, by Bremen or Hamburg mail by way of Marseilles—1 1/2 cent per ounce, and 9 cents per 1/2 ounce.

Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—6 1/2 cents per ounce, and 2 cents per 1/2 ounce.

The charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

A UNIVERSAL ALPHABET.—It is not generally known in this country that one and the same telegraphic alphabet is used in Great Britain, France, Belgium, Holland, the German States, Italy, Spain, Portugal, Malta, Switzerland, Denmark, Norway, Sweden, Russia, Persia, Greece, Turkey, Africa and India; also, for the Mediterranean, Persian, Gulf, and the Atlantic cables. This alphabet was originated by the Germans.

THE NATIONAL DEBT.—The January statement of the public debt shows the total debt to be \$2,642,325,251, while the cash in the treasury is \$134,200,603. This indicates a decrease in the debt during the past year of \$35,199,522.

THE INSIDE DOME OVER THE REPRESENTATIVES HALL IN THE INDIANA STATE HOUSE fell, on the 22d inst., with a loud noise, making a general smash up of the desks and furniture in the hall. The entire building is old, and this accident indicates a general insecurity.

WHILE CALIFORNIA IS PRODUCING \$45,000,000 IN GOLD, SHE PRODUCES \$60,000,000 IN FARM PRODUCTS, AND \$50,000,000 IN MANUFACTURED GOODS.

THE GOLDEN ERA.

Founded in 1857, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

THE CELEBRATED
Self Generating Portable
Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for lighting purposes, also for stores, factories, ballroom rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.
Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned off, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.
A small needle, bent at the point and fixed in a holder, may be occasionally required, to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.
When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.
Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 13v14-3m-8

Monthly Series, per month copy	65

The Circulation of the Press, already extensive, is rapidly increasing, and substantial tradesmen can now profit by widely disseminating information on their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories, will find no more effective or economical medium for advertising.

DEWEY & CO., Proprietors.

Patent Agency and Job Printing Office, 505 Clay street, San Francisco. [Am] Jan. 1, 1885.

College of California.

Department of Chemistry.

UNDER

PROF. W. B. RISING.

The Laboratory has recently been fitted up so that each student will be supplied with a set of Chemical Reagents at his own desk.

The Course of Instruction will include a thorough drill in Qualitative Analysis, and advanced students will be furnished every convenience for Quantitative Analysis.

Attention will be given to the detection and separation of poisons.

Also, instruction in the Assay of Gold, Silver, Copper, Lead, Mercury, and other Ores.

Students from abroad, prepared to proceed with the class in the studies of this department, may be admitted on application to the Professor in charge. 5v16tf

SULPHURETS;

What they are;
How Assayed;
How Concentrated;
And How Worked;
With a Chapter on the
BLOW-PIPE ASSAY OF MINERALS.

By WM. BARSTOW, M. D.

Published by A. Roman & Co., San Francisco.
For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ore, requiring but few materials, etc., except such as are generally to be found in the interior towns. 2v15tf

Japanning!

EQUAL TO ANY AT THE EAST, DONE ON ALL KINDS of Hardware and Carriage Work. Damaged Goods Repaired; Sewing Machines Japanned and Ornamented. 513 Fourth Street, between Bryant and Welch, San Francisco. 5v16-3m

N. A. BALL & CO., Prop'rs.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—*Yreka Union.*

Pacific Mail Steamship Co's

STEAMSHIPS FOR
NEW YORK, JAPAN AND CHINA.

LEAVE WHARF, CORNER OF FIRST AND
BRANNAN streets, at 11 o'clock A. M. of the following dates, for PANAMA, connecting to Colon, Panama Railroad, with one of the Company's splendid steamers from PANAMA for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.
On the 10th, 19th and 30th of each month that has 31 days.
When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo, All touch at Acapulco, and then to Panama. Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th is expected to connect with English steamer for Southampton and South America, and Australia, and P. R. R. Co's steamer for Central America. Through tickets can be obtained.

The following Steamships will be dispatched on dates as given below:

February 10th—GOLDEN AGE.....Capt. E. S. Farnsworth, Connecting with HENRY CHAUNCEY, Capt. Gray.
February 18th—GOLDEN CITY.....Capt. W. F. Lapidge, Connecting with the KISSING STAR, Capt. Connor.
February 28th—SACRAMENTO.....Capt. Wm. H. Parker, Connecting with ARIZONA, Capt. Maury.

Cabin passengers berthed through. Baggage checked through—10 pounds allowed each adult. Medicine and attendance free.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas. If desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched March 6th, at noon, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONG KONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidsdorff streets.

OLIVER ELDRIDGE, Agent.

INSTRUCTION

Parties wishing to learn the

Working of Sulphurets

BY THE

CHLORINATION PROCESS,

Can have an opportunity of doing so by applying to the undersigned, who are prepared to give practical instruction at reasonable rates. Apply to

Jackson, Amador Co., Cal.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,
San Francisco, May 24, 1886.
Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITREDGE & LEAVITT,
Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1887.
I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safe Locks in every other respect, as good as any other improved combination lock which I am acquainted with.

JOHN R. SIMS,
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1887.
I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:
1st.—Because it is impossible for either burglar or expert to pick it.

2d.—The lock being constructed without a key-bolt, it cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SHIPMAN, County Clerk.

JACKSON, April 27, 1887.
The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any burglar gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SHIPMAN, County Clerk.

CALIFORNIA LOCK ARCADE.—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—[Mining and Scientific Press, Sept. 29, 1886.]

They are the only SAFE lock ever invented. Every State and County Treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a series of rotating tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARK & C. EISEL,

No. 15 Post street.

W. JENKINS,
C. L. INGALLS, Supervisors.
L. MCCLANE,

Any good blacksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 80 in Pacific Coast Directory.]

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

1.—Assaying of Ores, Metals, and other Mineral Substances.

2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.

3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.

4.—Concentration.—Dressing of Ores.

5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.

6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

JOSEPH MOSHEIMER,

Pr. Chemist, Metallurgist, C. E., etc.

Mineral Land Law Blanks
FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866:

I. Applicants' Declaratory Statement.
II. Diagram, Description of Diagram and Boundaries, and Notice.

III. Register's Order for Publication—with Notice.

IV. Deposition that Notice has been Posted.

V. Application for Survey Etc.

Prices.—Single blanks, 10 cents; 75 cts per dozen; \$4 per hundred—postage paid.

Pamphlet containing the Law and the Instructions of the General Land Commissioner, post paid, 25 cts. Address DEWEY & CO.,

Mining and Scientific Press, San Francisco.

National Mineral Land Law, Instructions,
Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & CO., office Mining and Scientific Press, San Francisco.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

New Mining Advertisements.

Adella Gold Mining Company, Rock Creek,
Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of February, 1868, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 429 Pacific street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the sixth (6th) day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth (30th) day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. C. TAYLOR, Secretary.

Office, 429 Pacific street, San Francisco, Cal. feb8

Mining Notices—Continued.

Kearsarge Mining Company, Kearsarge
District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth (20th) day of January, 1868, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 413 California street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.

Office, 408 California street, San Francisco. Jan25

Lady Bell Copper Mining Company, Law
Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of January, 1868, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at 10 J. K. Johnson, at Crescent City. Any stock upon which said assessment shall remain unpaid on the tenth (10th) day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

B. P. WILKINS, Secretary.

Office, 648 Market street, San Francisco, Cal. Jan1

Mount Tenabo Silver Mining Company—
Location of Works: Cortez District, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the ninth day of January, 1868, an assessment of two dollars and fifty cents (\$2.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 425 Montgomery street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the twelfth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twelfth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.

Office, 425 Montgomery street, San Francisco.

P. S.—An allowance on the above assessment of three per cent. will be made on all payments prior to the 31st inst. By order of the Board of Trustees.

Jan1 R. N. VAN BRUNT, Secretary.

Nuestra Señora de Guadalupe Silver Mining
Company.—Location of Works: Tayoltita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third (3d) day of January, 1868, an assessment (No. 30) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Prager, at the office, No. 210 Post street, or to the Treasurer, A. H. MELMANN, at his office, No. 637 Washington street, San Francisco. Any stock upon which said assessment shall remain unpaid on the tenth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the third day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PRAGER, Secretary.

Office, No. 210 Post street, San Francisco, Cal. Jan1

Oxford Beta Tunnel and Mining Company, Es-
meralda District and County, State of Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the eighteenth (18th) day of November, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
C G Heath.....	147	10	\$5 00

P. CARROLL, Secretary.

Office, No. 87 Stevenson street, between First and Second, San Francisco. dec21

Postponement.—The above sale is hereby postponed until Thursday, the fifth day of

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference, as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the
PACIFIC FOUNDRY,
141 San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,
Pacific Iron Works.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

-BY-

WM. P. BLAKE,
Corner First and Mission streets, or Box 2,077
341st SAN FRANCISCO.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND PLACER MINERS, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address
Dr. J. B. BEERS, San Francisco,
Per Wells, Fargo & Co's Express.

NOTICE TO MERCHANTS
—AND—
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine depending upon the same.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:

No. 1—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price..... **600**
No. 2—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour..... **850**
No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour..... **1,200**

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the link or radius bar. E represents the bolts for regulating the opening. P, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1886.
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,
R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1884. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal proceedings, for past infringements or desirous of receiving Letters of License for the limited period named, are requested to address as below. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 25th, 1886.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1886.

WILCOX'S
Patent Steam Water Lifter.

Received First Premiums at the California State Fairs of 1866-7.

Send for Circular.

A Steam Pump without Engine, Piston, Plunger or Buckets, using both the expansive and exhaust power of steam, and doing more work with the same amount of fuel, than any other Pump driven by steam power. It is applicable to either lighter heavy work, whether for mining, irrigation, or other purpose. It has been used of various capacities, from 50 to 40,000 gallons per hour, and can be made of any size required. It is not injured by sandy or muddy water. In height of lift it is limited only by the strength of the boiler used.

An Extraordinary Invention--A
Steam Man.

The following story of a remarkably mechanical invention is told by the Newark (N. J.) Advertiser:

Mr. Zadock Dedrick, a Newark machinist, has invented a man; one that, moved by steam, will perform some of the most important functions of humanity; that will, standing upright, walk or run, as he is bid, in any direction and at almost any rate of speed, drawing after him a load whose weight would tax the strength of three stout draught horses.

The man stands seven feet nine inches high, the other dimensions of the body being correctly proportioned, making him a second Daniel Lambert, by which name he is facetiously spoken of among the work men. He weighs 500 pounds. Steam is generated in the body or trunk, which is nothing but a three-horse power engine, like those used in our steam fire engines. The legs which support it are complicated and wonderful. The steps are taken very naturally and quite easily. As the body is thrown forward upon the advanced foot, the other is lifted from the ground by a spring and thrown forward by the steam. Each step or pace advances the body two feet, and every revolution of the engine produces four paces. As the engine is capable of making more than a thousand revolutions a minute, it would get over the ground, on this calculation, at the rate of a little more than a mile a minute. As this would be working the legs faster than would be safe on uneven ground or on Broad street cobble stones, it is proposed to run the engine at the rate of 500 revolutions a minute, which would walk the man at the modest speed of half a mile a minute.

The fellow is attached to a common rock-away carriage, the shafts of which serve to support him in a vertical position. These shafts are two bars of iron, fastened in the usual manner to the front of the carriage, and are curved so as to be joined to a circular sustaining bar, which passes round the waist like a girth, and in which the man moves so as to face in any direction. Besides these motions, machinery has been arranged by which the figure can be thrown backward or forward from a vertical nearly 45°. This is done in order to enable it to ascend or descend all grades. To the soles of the feet spikes or corks are fixed, which effectually prevent slipping. The whole affair is so firmly sustained by the shafts, and has so excellent a foothold, that two men are unable to push it over, or in any way throw it down. In order to enable it to stop quickly, it is provided with two appliances, one of which will, as before stated, throw it backward from the vertical, while the other bends the knees in a direction opposite to the natural position.

An upright post, which is arranged in front of the dash-board, and within easy reach of the front seats, sustain two miniature pilot wheels, by the turning of which these various motions and evolutions are directed. It is expected that a sufficiently large amount of coal can be stowed away under the back seat of the carriage to work the engine for a day, and enough water in a tank under the front seat to last half a day.

In order to prevent the "giant" from frightening horses by his wonderful appearance, Mr. Dedrick intends to clothe it, and give it as nearly as possible a likeness to the rest of humanity. The boiler and such parts as are unnecessarily heated will be encased in felt or woolen undergarments. Pantaloons, coat and vest of the latest styles are provided. When the fires need coaling, which is every two or three hours, the driver stops the machine, descends from his seat, unbuttons "Daniel's" vest, opens a door, shovels in the fuel, buttons up the vest and drives on. On the back, between the shoulders, the steam cocks and gauges are placed. As these would cause the coat to set awkwardly, a knapsack has been provided that completely covers them. A blanket neatly rolled up, and placed on top of the knapsack, perfects the delusion. The face is molded into a cheerful countenance of white enamel, which contrasts well with the dark hair and moustache. A sheet iron hat, with a gauge top, acts as a smoke-stack.

The cost of this "first man" is \$2,000, though the makers, Messrs. Dedrick & Grosse, expect to manufacture succeeding ones, warranted to run a year without repair, for \$300. The same parties expect to construct, on the same principle, horses which will do the duty of ten or twelve ordinary animals of the same species. These, it is confidently believed, can be used alike before carriages, street cars and plows. The man now constructed can make his way without any difficulty over any irregular

surface, whose ruts and stones are not more than nine inches below or above the level of the road.

We give the above as we find it, although it looks decidedly Munchausenish.

SAD FATE OF A RUSSIAN ARCHITECT.—Albert Cavo, chief architect of the Imperial theaters of Russia, and designer of that of Moscow, on hearing, some years ago, of the intention of the government of France to construct a new opera house in Paris, devoted sixteen months in drawing the designs and plans of what he hoped would prove the eighth wonder of the world. He presented to M. Fould, then Minister of State, who, struck by the magnificence of the design, laid it before the Emperor. His Majesty not only approved of the design, but conferred the Legion of Honor on M. Cavo, meanwhile expressing his wish that the plans should be laid by till the opera house should be built. Years elapsed; when the time arrived for the erection of this temple of art, M. Cavo, on reading in the *Moniteur* that a competition would take place for the plans, telegraphed to Paris requesting that his designs might be placed amongst those of other architects. The reply was that they could not be found. The poor man wrote successively to M. Fould, to the Duke de Morny, and to the Russian Ambassador, imploring them to use their influence to have the plans searched for. But in vain; the designs were lost. On the news reaching him, M. Cavo was struck with apoplexy and died within a few hours.

Life safety on railroads, in our dwellings, our offices, our public buildings, and on the streets and rivers is becoming the grand object of social anxiety and inventive effort. All the intelligence of the time is summoned to the solution of the problems it suggests. Insecure walls, weak boilers, decrepit machinery, insufficient means of exit, rotten timber, explosive storages, etc., etc., have held a public slaughter throughout the last year. A grand uprising against them is now proposed, and it would not be a bad idea to establish mutual protective societies to accelerate reform. Strict responsibility is another element of safety that we do not doubt would help the cause amazingly.

ANTHRACITE COAL PRODUCTION.—The anthracite coal production from the several regions of this country for the past year, exceeds that of 1866 by some 50,000 tons, and aggregated about 13,000,000 tons.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and they will be held responsible in law and in damages. Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. **BLAKE & TYLER,**
Agents for the Pacific Coast.

ELLERY'S Patent India Rubber Paint and Cement

Is composed of India-rubber and other gums, dissolved in pure linseed oil, mixed with the various coloring matters, and ground in any color. We paint Wood, Brick, Metal, Cloth, etc. It is a superior Marine Paint. Will not rot, peel, blister or crack in any climate. Fifteen hundred Fish Vessels at Gloucester, Mass., use it as superior to other paints. We refer to Steamers America, Senator, Paul Pry, Julia, etc., and W. K. Van Allen, S. C. Bogbee & Son, Tubbs & Co., C. W. Thomas, Sidney Johnson, Dr. Newton, Gen. Conoor, Stockton, H. L. Davis, Jas. Lick, J. P. Pierce, Esq., and others. Filbert Street School House, two coats on redwood, equal to three coats lead. One hundred pounds paint equal in bulk to two hundred pounds lead. Cementing and painting new or old Tin or Metal Roofs. We first cement around fire walls and skylights all holes and cracks, then apply a good coat of paint. A good, clean, tight roof is certain. Price, from one to three cents per square foot, according to size and condition of roof.

New Cloth Roofs put on, saturated with liquid rubber; then painted at nine cents per square foot. We use none but the best materials and pure linseed oil. No lead turpentine; neither asphaltum or coal tar.
Also, for sale, "Submarine Rubber Varnish," \$5 per gallon; any color. We will apply to Vessels' Bottoms, or furnish at \$5 per gallon.

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—In setting up, set the pan, A, level by the inner rim, near its center.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets.

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (7 Concentrators).....	Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (6 Concentrators).....	Grass Valley, Nevada County.
NORRIDGEWOCK MILL. (2 Concentrators).....	Grass Valley, Nevada County.
VALENTINE & CO., Commercial Mill (3 Concentrators).....	Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....	Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators).....	Hunter's Valley, Mariposa County.

MOREY & SPERRY (1 Concentrator).....	New York.
GUADALUPE & SACRAMENTO G. & S. M. CO.....	Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....	Soaoa, Mexico.
B. F. BROWN (1 Concentrator).....	Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco.

Yours, very truly,

LOUIS JANIN, JR.

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thank for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness:

GEORGETOWN, January 22, '67.

Messrs. Dewey & Co.—Sir: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Letters Patent" on my application through you for an "Improved Machine for Washing Dyes." It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf.

Very truly yours, M. A. WOODSIDE.

Economy in Advertising.—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

LANDS ON THE PACIFIC RAILROAD.—A very large portion of the finest agricultural lands of the State are along the lines of the Central and Southern Pacific Railroads. Either from a misconception of the Act of Congress which granted to the railroad companies the odd numbered sections for a width of twenty miles on each side of their track, or owing to the faulty wording of the said Act,—compelling him, if strictly rendered, so to do,—the Secretary of the Interior decided that both the odd and even sections were by its terms withdrawn from preemption and sale. A sensation was created by this decision, as may well be believed; for it is not, of course, to be supposed that such was the intention of the Act. It has been supposed that the sections numbered even would be open to settlers at \$2.50 per acre; thereby bringing in the same revenue as if all were priced at \$1.25; and the railroad companies have therefore held their portion at that price. The telegraph informed us on the 8th inst., that the Lower House of Congress has, at the instance of one of our Representatives, passed a bill restoring to market the even sections. It is to be hoped that it will become a law. Immigration would thereby be encouraged, and a large amount of taxable property created.

MAP OF THE REGION ADJACENT TO THE BAY OF SAN FRANCISCO.—The new map just issued by the State Geological Survey, is a most perfect affair. It is on a scale of two miles to an inch, and is about three feet nine inches in length and two feet nine inches in width,—exhibiting the region included between Napa and Sonoma on the north, and a point about 12 miles below New Almaden on the south. A meridian line drawn at about the same distance east from the same point would be the boundary of the map in that direction. The Coast, Rancho, Township and Section lines are from material furnished by the U. S. Coast Survey and the U. S. Surveyor General's office; and the topography chiefly from original surveys by C. F. Hoffman. The engraving is clearly and distinctly executed. It is an elaborate and beautiful piece of work, and reflects the greatest credit upon the Survey.

Hughes' New Quartz Battery.

We give herewith an illustration of a quartz battery, quite novel in construction, and the invention of Mr. Seymour Hughes, of 215 Third street, San Francisco. The object sought by this invention is to provide a cheap, compact and efficient machine that will combine the work of both stamps and pans. The inventor, after some two years of experiments, and several weeks of actual working trial of his machinery, is quite sanguine that he has accomplished his purpose, and he is now ready to demonstrate this fact to the mining public. He feels fully confident that he has provided

ordinary battery, is here most judiciously applied to grinding the ore.

A battery six feet in diameter, will contain nine stamps, or can be used with a less number; as is evident from the engraving, where only two are seen. A battery of five stamps, rigged for horse power, will cost but \$700; or \$750 rigged for steam or water power. It has been found by actual practice that two horses can run one of these batteries containing five stamps, weighing 400 pounds each, dropping nine inches, and having four drops in the circle. The wear of the shoes and track is true and uniform, and their bearing one upon the other is peculiarly favorable for its results as a grinder

HUGHES' NEW QUARTZ BATTERY.

for the prospecting miner, in particular, a mill fully equal to his requirements, one that can be run by horse, steam or water power—one that contains the least amount of metal in proportion to its capacity for work, and one which can be purchased and put in position for work cheaper than any mill now in use which will do a like amount of work.

The chief novelty of this machine consists in the fact that it is a grinding as well as a stamp battery. The crams and canchast usually employed in a stamp battery, are dispensed with in this invention, and the frame work to which the stamps, D, D, are attached, is made to revolve, so that the faces of the stamps are forced over a series of inclined planes, F, F, each plane raising the stamp so as to admit of a drop of nine inches from the top of one plane to the foot of the next succeeding one. A die, J, is placed at the foot of each plane to receive the drop of the stamp. The passage of the stamp up the incline enables it to accomplish a large amount of trituration, thus doing away with all necessity for subsequent pan grinding.

By this arrangement for lifting the stamps, it will readily be seen that the friction involved in accomplishing that purpose in the

and amalgamator. The action of the machine is such that the stamps rotate as they revolve. The inclined center, B, and, below the screens, A, are provided with copper amalgamating plates for the collection of amalgam by the splash of the stamps. The total weight of all the work about a 5-stamp mill will not exceed 5,000 pounds, exclusive of stamps, which may vary from 250 to 400 pounds each. The largest piece will not weigh over 500 pounds.

Mr. Hughes, the inventor, is now engaged at the Miners' Foundry building one of his 5-stamp batteries in the very best shape which his experience can suggest.

By a singular coincidence, Mr. E. J. Wilson, of the Delta Quartz Mining Company, at Fairplay, El Dorado county, has also been at work for a year or more upon the very same idea as that which has engaged Mr. Hughes, and has actually constructed a mill of sixteen stamps, on precisely the same plan. The two mills are absolutely identical, in every part of their construction; and yet neither had any knowledge of the experiments of the other, until a newspaper notice of Mr. Hughes' mill attracted the attention of Mr. Wilson. Mr. H. claiming to have been the first to commence his experiments, and to make his

application for letters, is, if so, thereby secured in the monopoly of the manufacture and vending of these mills. Mr. Wilson of course will continue to run his mill, by virtue of his right as its inventor. He has already crushed about 400 tons of rock with it, and reports that he can crush nearly twice as much rock with this as with the ordinary stamp battery—the same amount of power being employed in both. He also claims that he can obtain more gold from the same rock. The latter advantage, whatever it may be, is of course due to the large amount of trituration which takes place in the battery—the battery in fact performing the work of both stamps and pans. The effect of the sliding motion of the stamp, as it feeds, and subsequently rises, is very perceptible to the eye, when the mill is at work dry; full as much, if not more work appears to be done while the stamp is traveling up the incline, as is accomplished by the simple act of dropping. By working it as a float battery, on the principle elsewhere described in this issue, any desirable degree of fineness can be obtained.

This invention is certainly novel in its character, and so far as we can see, is eminently promising in its effectiveness. We shall watch its practical application with much interest, and endeavor to report results truthfully.

DEATH OF SIR DAVID BREWSTER.—A London telegram of date February 11th, announces the death of this eminent scientist, at the age of eighty-six. His name is among the noted ones of a former generation. He was born at Jedburgh, Scotland, in 1781. He received the degree of M. A. from the University of Edinburgh in 1800; the degree of LL.D. from the University of Aberdeen in 1807; and was elected a Fellow of the Royal Society of Edinburgh in 1808. On the death of Berzelius, he received the distinguished honor of an election as one of the eight Foreign Associate members of the National Institute of France.

Sir David Brewster is especially known for his discoveries in reference to the polarization of light, and his other contributions to the science of Optics. He invented the kaleidoscope and the stereoscope,—and constructed lenses of superior excellence for light-houses. He was a contributor to several scientific publications, the author of several scientific works, and the editor of the *Edinburgh Journal of Science*. The *Edinburgh Encyclopaedia* is a monument of his industry. Upon this work he spent the greatest part of twenty-two years. He was the founder of the British Association for the Advancement of Science, and one of its most active members throughout the whole of his long life. He received an annual pension from the Government; and his last invention, the stereoscope, made at the age of 67, was probably a source of considerable profit.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER TWELVE.

I have considered it most convenient to place more prominently the losses according to the mode employed, which are attendant on the reduction of gold and silver ores, before dwelling upon the charges consequent on such diverse operations, because in many cases the question of advantage or disadvantage resulting from the employment of any particular process will frequently depend upon the question of the more or less perfect extraction of the hullion from the ore. In simple comparisons, as when the charges for reduction prove equal, this proposition must be clear to any one; when, however, the charges are higher in one case than another, as would be if either amalgamation by harrel, or reduction by means of Augstin's or Ziervogel's modes is contemplated to be adopted in place of the Washoe pan mode, it becomes a serious question, at what point does the advantage of one mode commence, or the other terminate.

Having roughly reviewed the probable losses resulting from non-extraction sustained by various modes, and having approximately shown that on a ton of prepared mattes or ores reduced by the barrel, brine and hot water modes, the losses so arising, even though such mattes or ores originally contained hullion to the amount of from \$100 to \$400 per ton, and upward, do not exceed \$15 per ton, while it amounts to more than that sum on a \$50 ore by the Washoe method, and on a \$400 ore or matte would sum up to \$200 per ton, it consequently follows that the methods first noticed are superior in this respect to the Washoe mode—in the instance last named of not less than \$185 per ton, which difference would be a gross gain on this account to that amount for the one series over the pan mode, and a nett gain, minus the extra charges consequent on the employment of the harrel, brine, or hot water methods; the chief of which will be found in the department known under the general term,

ROASTING.

Of all the processes connected with the reduction of gold and silver ores, the most expensive is that pertaining to roasting, and is at the same time most difficult of satisfactory performance on an economical scale. Plattner has written a fair sized volume on this important subject; as, however, the experiments detailed by him are almost exclusively on a small scale, and often relating to the employment of hydrogen or steam as accompanying agents, which to some extent will be expensive, renders Plattner's volume, though extremely valuable as pointing out the proper course to pursue under varied circumstances, readily to be understood by a thorough expert, is perfectly bewildering to an ordinary reader. Having had the opportunity of studying this subject on a large scale, in almost every form and variety of ore, and having also practiced no inconsiderable number of these methods with mixed ores, in almost numberless varieties, more or less associated with antimony, arsenic, sulphur, gold, silver, lead, copper, iron, zinc, and occasionally tin or bismuth, I am enabled to hear practical witness as to the numerous difficulties, and can emphatically state, that in order to detail and make tolerably clear to the intending learner the various shoals and quicksands that environ the process with some complex ores, would form even a larger volume than that furnished by Plattner, many of which however are distinctly alluded to by that learned metallurgist.

For the present, by way of illustration, however, I shall confine myself to a difficulty of the very simplest character, especially as it is one on which ocular proof can be obtained in California more readily

than any other. Allusion is here made to Plattner's method of roasting concentrated or naturally highly charged sulphureted gold ores (pyrites) prior to chlorination, in which it is well known how much more difficult it is to drive off the last ten per cent. of sulphur than the ninety that had previously been dissipated. The case just alluded to is, however, simplicity itself as compared with most of the other complexities alluded to, not only as respects the actual preliminary manipulation, but also as regards the injurious influences which, under certain circumstances, may supervene consequent on imperfect desulphurization.

On no subjects connected with the metallurgy of the precious metals, has so little advance been made during the last century as those relating to the formation of constructions for roasting ores, and accompanying devices for regulating the temperature and supply of oxygen therefor. It is one that has occupied a very large share of the writer's attention, particularly so during the last four or five years, for previous to that time alluded to having, as he believes, acquired a knowledge of all the methods that are now employed, or probably may hereafter be found of any very great future economic advantage in the reduction of gold and silver ores.

As the above remarks were being penned, I had placed in my hands a copy of Mr. Kustel's recently published work, in which I am glad to see that large furnaces, extended greatly in their length, are recommended. Mr. K. states that Mr. Deetken, at Grass Valley, has found it advantageous to construct such, like those employed for roasting lead ores at Pontgibaud (France), in which "the upper hearth is not above the lower, but a continuation of it, interrupted by a step-flue of seven feet ten inches in height. The upper hearth is six feet wide by thirty-nine feet in length, furnished with working doors upon each side, twelve in number." A large furnace of a somewhat similar plan was employed by me, many years ago, at Flint, North Wales, with the same object that such is now used at Grass Valley. In my own case, however, the furnace was divided into four parts, separated only by a step to each of from six to nine inches in height, and each division was from ten to twelve feet in length, thus making the entire furnace from forty to fifty feet long. The mode of making the fire-places was somewhat peculiar, and could not be explained without a drawing. The disadvantage of this kind of furnace consists in the employment of manual labor for the purpose of stirring the ore, in order to expose all portions thereof to caloric or oxidizing influences.

In this last respect, revolving furnaces, with automatic stirrers, possess advantages of an economic character very much greater than pertains to the variety of furnaces just described. There, however, I am afraid their sole advantage ends, as much greater economy of fuel will be found attendant in the employment of lengthy reverberatory furnaces of the kind above noticed, than with those of a rotary character. Besides the difference of the amount of manual labor required between the two modes is much diminished by the fact that so much larger an amount of stuff can be worked on the bed of the elongated rectangular reverberatory furnace, as compared with those of a revolving circular construction, as the latter cannot safely be constructed to work more than about one ton at a time; while, on the other hand, large rectangular furnaces may easily be constructed so as to effectually work from ten to twelve tons continuously; so that what with economy of fuel (the sulphur consumed being made in part to form a source of the caloric employed), and the quantity that can be operated upon by a single hand, will perhaps fully balance any saving that may arise from automatic agency, unless, which is a matter only ascertainable by experience on a working scale. The ore can be completely desulphureted in less time by revolving furnaces; for I can fully corroborate the experience made by Mr. Deetken, and noticed in the work of Mr. Kustel, already alluded to, that (unless at an unreasonable expenditure of fuel) "long experience in California has proved that a certain length of time—about twenty-four hours—is required to finish the roasting of one charge." Under all circumstances, the probability is that no great improvement in cheaply desulphureting ore is likely to be discovered, unless it be by the introduction of some economical mode of dissipating the last ten or twenty per cent. of sulphur which remains in the ore. The application of nitrate of potash or soda at this stage would facilitate the operation; but unless with very valuable ores, these salts would be found too expensive. Mr. Kustel's work is not only deserving of study as regards that branch of reduction immediately under

notice, but will, on perusal, be found worthy of deep attention in respect to several others, especially of those relating to the dressing of ores with the object of obtaining the valuable portion of the ore in as concentrated a form as possible. An attentive study of this work must satisfy any clear-minded reader that non-effective results must of necessity be the consequence of the hitherto and still prevailing mania of "rushing things through," as an instance of which, no better illustration can be given than the tables furnished for one year's operation by the

HALE & NORCROSS COMPANY.

By the tables noticed, for a copy of which I am indebted to Mr. H. C. Bennett, it appears that for the year ending March 1st, 1867, this company had reduced 15,639 tons of ore, the assay value of which was, for gold, \$465,290, and silver, \$822,942—total, \$1,288,132. The amount produced was as follows: gold, \$397,158; silver, \$419,819—total, \$816,977. The amount lost was, for gold, \$68,474; silver, \$403,123—or, conjointly, more than \$470,000, the average percentage of loss on the gold being fourteen per cent. and that of silver forty-eight per cent. Cost of reduction, \$14 per ton. Some instances occur where the amount of gold extracted run up from ninety to ninety-nine per cent., and in one instance the return is made of 112 per cent. on the fire assay. One return, by much the highest, for silver, gives eighty-one per cent.; but several go as low as forty-five, and some fifty-one to fifty-two per cent., remarks respecting which must be reserved to a future day.

The Mining Establishment of France.

The materials for the following notice of this establishment were taken from the *Compte-Rendu des Travaux des Ingenieurs des Mines*, and the *Annales des Mines*, by Prof. Smyth, whose account of the mining schools of Saxony and Hungary we have already given.

ESTABLISHMENT OF THE CORPS DES MINES.

The *Corps des Mines* was established by an order of Council in 1781, and was reorganized in the second and fourth years of the republic. Other regulations have been made in various subsequent years. It was made the duty of the mining engineers to make a geological and mineralogical examination of France; to guide the labors of miners and the searchers for mineral substances; to arrange the limits of "concessions," or permits, in different districts according to the circumstances therein,—for which concessions a royal *ordonnance* was then issued; to indicate the manner in which the works should be carried on; to keep watch over the safety and the solidity of the works, and give such instructions and advice as to prevent accidents; to estimate the value of the mines in order to determine the royalties due; prepare regulations in regard to drainage; to determine, by actual experiment, the safety of all steam apparatus; to give all necessary information in regard to the nature of the ground, and other points, to government commissions who are to make preliminary surveys for roads, canals, etc.; to examine, for the public and commercial security, the regulations of mining companies; and to instruct students of engineering, and prepare them for the position of master miners.

The mining engineers are thus not only scientific investigators, but advisers of the *Administration des Mines*, in whose hands is placed the actual supervision over all mining matters. Trial works are under their inspection, when carried on at government cost or that of the parishes or departments,—and sometimes when undertaken by private parties. The *Administration des Mines* is consulted upon, and watches over, researches upon parish or private grounds, for which permission must be obtained from government. A periodical inspection of workings and of machinery is required by the regulations,—also that of the daily record of progress which is kept; and all necessary instructions are given at the time of the visit. An account of the condition of things is rendered to the Prefect. The corps of

engineers publishes two volumes annually, entitled *Journal des Mines* until the year 1816, but since that time *Annales des Mines*.

THE SCHOOL OF MINES OF PARIS

was founded by Louis XVI, in 1783. At first the three years' course included lectures in winter, and in summer tours with the inspectors, or a residence in the mines. Pupils entering were required to be sixteen years of age, and to have a sufficient acquaintance with geometry, drawing and German. The mining engineers were selected from among these students. In 1795, it was changed from an elementary to a practical school, and the twenty pupils were chosen from among those of the Polytechnic School who were most proficient in mathematics. In 1802 it was removed to Pessey, in Savoy, where a lead mine was being worked by the State; and a second practical school was founded at Geislautern, in the old department of the Sarre. In 1816, after these two places ceased to belong to France, the school was reestablished in Paris. The number of students of engineering was reduced to nine; and an equal number of outside students (*eleves externes*) were admitted to the course, who received, on leaving, certificates of proficiency, as shown by the annual examinations. The management,—at first with one director,—was now placed with the council, composed of the Inspectors-General of the corps of mines, professors and the inspector of the educational department.

COURSE OF STUDY.

The course of study is under the direction of the engineers, and comprises mechanics, and the working of mines; assaying and laboratory work in general; metallurgy, mineralogy and geology. The pupils also receive instruction in drawing, surveying, and in the German and English languages. The lectures occupy from November 15th to April 15th. The course is for two years, although most pupils remain three years. The first summer is devoted to laboratory work and surveying; the second and third to the visiting of mines and furnace works. Although the lectures are not public, there are, besides those students already mentioned, from 25 to 30 free or authorized students, and a number of young Russian, American and Spanish engineers, who attend them. The collections of minerals, fossils, metallurgical and chemical products, models, and drawing of machines and furnaces, are very extensive.

SCHOOL AT ST. ETIENNE.

The Miners' School at St. Etienne was founded in 1816. It is in the midst of the rich coal district of the Loire. At first intended to educate mining captains and master workmen, it was, in 1831, so modified as to include, on the one hand a higher course than at first, and on the other an inferior one for workmen. The instruction is gratuitous; and free students are allowed to take only a partial course, at their option. Regular students are required, on admission, to be acquainted with elementary arithmetic, the metrical system, surveying, and the French language. The course is for two years; and comprises, in the first year, arithmetic, geometry, elements of algebra, trigonometry, plan-drawing, leveling, descriptive geometry and its application to masonry and carpentry, general chemistry, assaying, mineralogy and book-keeping; in the second year, courses on mechanics and machines, the working of mines, metallurgy and building. The working-class students, are required, for admission, to have passed through the ordinary primary school course. During the first year, they are instructed in weights and measures, the elements of geometry, plan-drawing and leveling, book-keeping and linear-drawing; during the second, in elementary physics, chemistry and mechanics. This school has large collections of every kind, a library, and chemical laboratory. The regular students are frequently examined, and on completion of the course, receive certificates of proficiency according to the result of the yearly competition. The school is under the direction of the Inspector-General of the mineralogical division, of which the department of the Loire forms a portion; the chief engineer is his aid, and three mining engineers take part in the administrative council.

SCHOOL AT ALAIS.

In 1845, a third school was opened at Alais, in the *departement du Gard*, under the direction of an engineer of mines. It was intended for the instruction of intelligent workmen destined for the position of foremen of works. Besides these institutions, laboratories for analysis, modeled to some extent upon that of Paris, have been established at several places.

Mechanical.

Working Velocity of Steam.

The initial velocity of steam when rushing into a vacuum under only fifteen pounds pressure, is set down at 90,000 feet (about seventeen miles) per minute, while the most advantageous or economical rate of speed for the employment of steam in an engine is generally set down at from 300 to 400 feet per minute. The correctness of the theory of the above proportionment of the initial to the working velocity of steam has been questioned. We are not aware that any carefully executed comparative experiments have ever been made to determine at what rate a piston should travel to develop the greatest effective force. Very little, if any attention appears to be given to regulating the velocity of the piston to the pressure; and yet it is quite apparent that there must be an immense increase of initial velocity between steam escaping at 15 and 150 pounds pressure. A writer in a late number of the *American Artisan*, in discussing this subject, says:

"It seems to my mind that the most profitable velocity at which steam can travel is its slowest—that is to say, more power can be obtained from a given volume of steam in a closed cylinder, moving at a very slow velocity, than a moderately high one. Thus, a little extra work thrown upon an engine affects its speed, but a considerably increased resistance is necessary before altogether stopping it. This cannot be accounted for by any considerations affecting the ingress of steam, as we know, however freely supplied, an engine works faster under a light than a heavy load. Hence I argue that, to extract the fullest amount of power from the steam, the piston should move at the lowest possible velocity; or, in other words, should be all but counterbalanced by the resistance of the work, which, if necessary to be driven fast, should be affected by suitable gear arranged between the prime mover and it; nor need the friction consequent upon such method of working at all approximate the loss or reduction in force attendant upon a high velocity of the piston. To demonstrate this, let the weights capable of being lifted by the piston moving at the two velocities of 10 and 200 feet per minute be ascertained, and compare the difference with the possible loss by friction consequent upon employing well-constructed gear to produce the higher velocity from a piston traveling at the lower one, not omitting to give the slower moving engine credit for its diminished friction, etc.

My impression is that, though to produce a given result a proportionately increased area of piston surface would be required, less steam would be used, or, to otherwise express it, more power obtained for a given volume of steam traveling at an unusually slow than moderately quick speed. Be this as it may, however, I am utterly at a loss to understand, while in simple emission or reaction engines there is an acknowledged increased loss of power if the same move at a materially less speed than the initial velocity of the steam, how or why in a closed cylinder arrangement an arbitrary rate of speed of from 300 to 400 feet per minute, altogether or mainly so irrespective of pressure whether high or low, should be regarded as the only correct and most profitable velocity for the employment of steam. There may be a satisfactory solution of this, but as at present advised I am disposed to doubt whether the theory of working steam to the fullest advantage is at present understood, and am inclined rather to believe that a hackneyed, as distinguished from a rational, system of employing it prevails.

FLY WHEELS ON RAILWAY CARRIAGES.—An arrangement for storing up the force of gravity so as to prevent the variations of speed on a track which is undulating, is under trial in Paris. The locomotive has two heavy fly-wheels, capable of being made to work with or in opposition to the driving wheels. During the descent of a down grade, these retard the engine, revolving with rapidity, and storing up the power which they absorb. When it is necessary to ascend an up grade, they are so connected in the reverse way with the driving wheels, that they cause them to revolve and propel the train. The velocity is therefore kept in some degree uniform.

FRENCH TOOLS.—To our eyes French joiner's tools are very primitive articles; the saws are bow saws; the planes are all jack planes; the chisels but few and rough looking. The ironmongery seems equally old fashioned; nails like shoeing nails, hinges like those of an old Paris register box. The material all seemed good, many tool makers profess only to use steel made from Swedish iron. But the tool makers' window would not prove very attractive to our joiners except for curiosity. Of course French joiners declare that their tools are better than ours. One told me that he brought his over here to work in town, and found them better than his companion's tools—I don't think his companions thought so too. But there is no doubt Jean turns out some good work with his few plain looking tools. I hope your readers will understand that what I said last week in reference to French and English joinery, meant only to convey that, on the whole, our work was better than theirs, and not that they did no good work, for I saw some capital work. Yet even this was in a class of work where manipulative and quasi-artistic skill would serve in more stead than simple mechanical skill, as in Gothic church work, particularly traceries, panels, and stopped moulded chamfering and semi-cabinet work in doors, etc. In all those kinds of work I saw some very superior handicraft, both in Paris and the provinces. There was some church work at Rouen that was equal in spirit to the best old work I have ever seen, and superior in execution, and that is saying a great deal. *Builder's Trade Circular.*

TO MAKE WINDOWS IN IMITATION OF STAINED GLASS.—Take cotton or other fabric or paper on which any required pattern or design has been printed, and prepare this fabric or paper by saturation in oil or otherwise, to render the colors more brilliant and transparent; the fabric so prepared is then laid on a sheet of plate glass, and is caused to adhere to the glass by means of varnish or cement; a second sheet of glass is then laid over the fabric or paper, and the whole is secured to the window sash or other article to be glazed in the usual manner.

WOODEN WALL HANGINGS.—A machine has been invented by a Bostonian for preparing a wooden substitute for paper hangings. A log of suitable length and size is squared, and is then by the machine shaved into thin sheets of the usual width. These are put upon the wall with posts in the same manner as those of paper, and while wet. It is said that they are more manageable than paper, being tougher.

EXPENSIVE BUILDINGS.—The Park Bank building in Broadway, adjoining the *Herald* office, now approaching completion, is pronounced by competent judges to be the finest edifice in the country. But a few months ago the *Herald* building was one of the grandest-looking edifices in its neighborhood; to-day, alongside of the Park Bank, with its massive ornamentation of white marble, it is quite dwarfed. The cost of this building is estimated at \$420,000. This sum includes the cost of the land.

The foundations have been in progress for several months of a building that will surpass in grandeur the Park Bank as much as the latter building surpasses its neighbors. This building is to be erected by the New York Life Insurance Company, and will cost one million of dollars. Its exterior will be very imposing, the design being taken from the Temple of the Erechtheus at Athens. The material used will be white marble, of course, brown stone having gone out of fashion for public edifices, as it ought to for private dwellings. The façade of this building will, like the Park Bank, be profusely decorated with pilasters, columns, cornices, etc., in the Ionic order, and will be of massive proportions.—*N. Y. cor. Bulletin.*

LOWER CALIFORNIA MINES.—The Lower California correspondent of the *Bulletin*, under date of January 30th, gives these items: The last month's run at the Triunfo Company's mill yielded \$76 to the ton. The Mexican Co. are working on the slow process, taking out about 1,000 tons yearly, which they ship to Freiberg. The San Juan mill of four stamps has got to work again, turning out about \$4,000 per month. The shipments in silver bars to San Francisco by every steamer average about \$30,000. Mr. Morgan, owner of the San Narcissa mine, has commenced to melt his ores, and the results have been favorable. The rest of the mines are held under prorogue, at a cost of about \$5 per month, the owners, like Micawber, waiting for something to turn up.

Scientific Miscellany.

THE FLOW OF STEAM AND OTHER ELASTIC FLUIDS.—The *Journal of the Franklin Institute* for September, 1867, accredits R. D. Napier with certain propositions upon the above named subject, which were long ago enunciated and proved by Eli W. Blake, of New Haven. The propositions were as follows:

First.—"The greatest rate at which steam will flow from an orifice into a vacuum, is only half of that generally stated and given in the tables published on this subject."

Second.—"Steam or any other gas, at a given pressure, will rush into any pressure less than half its own, exactly as into a vacuum. Thus, steam of anything over two atmospheres will escape into the air or into a vacuum at the same rate."

Mr. Blake, in a communication to the aforesaid journal, dated Sept. 18th, thus speaks of an article contributed by him to the *American Journal of Science and Arts*, twenty years ago, and therein published:

"In that article the propositions accredited to R. D. Napier, were fully stated and proved by the most rigid and conclusive mathematical reasoning; and the true law was given for the flow of steam or other gases under all possible relations of the densities in the discharging and receiving vessel."

Soon after the publication of the article, I called to it the attention of the then editor of the *Journal of the Franklin Institute*, as developing truths of much practical importance, and desired its publication in this journal in order that it might reach a larger number of practical engineers than it was likely to reach through the pages of the *American Journal of Science and Arts*; but I was informed that it was not in accordance with the plan of this journal to reprint articles which had already appeared in other journals.

Three years after the publication of the article, having, in the meantime, learned that several of the most eminent mathematicians in this country, after reading it, had, without further examination, pronounced it unsound, on the ground that it was incredible that the elastic force of the steam in the receiving vessel should not, under all circumstances, have the effect to diminish the flow through the orifice, I devised and carried into effect a plan by which, in a single experiment, the law could be tested throughout its entire range, and in a manner perfectly unexceptionable and conclusive.

An account of this experiment and its results was given in the *American Journal of Science and Arts*, vol. xii., new series, page 186, and I venture to say that never was a physical law, deduced by pure mathematical reasoning, more fully and completely proved by experiment than in this case."

ELECTRICITY IN VACUO—AURORA BOREALIS.—M. Alvergnyat, of Paris, has constructed a new apparatus for demonstrating the fact that electricity will not pass through a perfect vacuum. In a tube containing two platinum wires, the free ends of which are one-eighth of an inch apart, a nearly absolute vacuum is produced by means of a mercurial pneumatic machine. After half an hour's action, the tube is heated to redness, and still further exhausted of air until the electric spark ceases to pass even through the small space between the wires. The experiment goes to prove that the Aurora Borealis can take place only within the limits of our atmosphere, and also that that atmosphere extends, in an attenuated state, to a great height.

NEW CHEMICAL REAGENT.—A new and highly sensitive chemical test for acids and alkalis has been prepared by Prof. Bottger from the leaves of an ornamental plant, *Colons Verschaffeltii*—so called in honor of the Dutch horticulturist, Verschaffelt. The fully developed leaves are digested in alcohol, and slips of Swedish filter-paper soaked in the decoction take a beautiful reddish tint, which becomes green under the influence of an alkali or alkaline earth. As this reagent is not affected by free carbonic acid, it may be used in detecting carbonate of lime in water. If a strip of this paper moistened with water is held over a burner from which gas is issuing, the greenish tinge appears, in consequence of the ammonia from which, perhaps, no gas is entirely free.

CAUSE OF THE TRADE WINDS.—J. Knox Loughton, of the English Royal Navy, communicates a paper to the *London, Edinburgh and Dublin Philosophical Magazine*, in which he takes the ground that the trade winds are not due to the streaming in of the air towards the place of greatest heat, as has been commonly assumed. The temperature of the air over the sea at the equator seldom exceeds 82° Fah.; while in many parts of the world it is, on land, considerably higher. Over a large part of Africa, for instance, north of the tropic, it is seldom less than 90°, and often over 100°; sometimes as high as 112°. Much higher temperatures have been noted at times in other regions. The Atlantic air from the latitude of 30° north, at, say, in summer 75°, rushes southward to where the thermometer stands at 82°, instead of eastward where it is 100°; as would be the case if the commonly received theory was the true one. The paper goes on to show ground for believing that "sudden condensation of aqueous vapor is the principal cause of the trade winds, of their inflection towards the west coast of Africa, and of the Indian monsoon, in opposition to the theory which derives these winds from the mere expansion of the intertropical air by heat."

"VITAL FORCE."—Wm. Odling, F. R. S. of London, has recently published a series of lectures on American Chemistry, intended to show that there is no such thing as "Vital Force." We quote: "By burning off successive atoms of carbon and hydrogen, the chemist can transform the most complex organic substance into more and more simple ones, until at last he arrives at carbonic acid and water; and then, by reversing the process, and removing atom by atom of oxygen from carbonic acid and water, he can build up, stone upon stone, the edifice which he has taken down. This same conservation of force pervades the inorganic and organic. The sun's force which removes from carbonic acid and water their oxygen and forms plant-tissue, is given out by the oxidation of animal tissue, a unit of heat or mechanical or chemical force being evolved for each unit of solar force absorbed. The supposition of a vital force is not more necessary to account for the formation of organic compounds in the animal body, than it is for their formation outside the body."

THE ACTION OF OZONE ON SENSITIVE PHOTOGRAPHIC PLATES.—At the meeting of the Dublin Chemical and Philosophical Club on Dec. 12th, Dr. Emerson Reynolds stated that he had found that when the image before it is developed is submitted to the action of ozone, it is completely obliterated, and that a second image might be taken upon the same plate. He remarked that this was against the mechanical theory of photographic images, and that it was due to chemical change in the sensitive film. He thought that the difference in the length of time for which dry plate remains sensitive, was probably due to the difference in the quantity of ozone present in the air at different times. * * At the same meeting, Dr. Frazer stated that he had kept specimens for efflorescing minerals for years by smearing them with glycerine.—*Chemical News.*

KEROSENE LAMPS.—It is said that the light of coal oil lamps may be greatly improved by adding to the oil one-fourth its weight of common salt. It makes the light much more brilliant and clear, keeps the wick clean, and prevents smoking.

ALLOTROPISM.—If phosphorus be sealed up in a piece of glass tube, and warmed for a few days, it becomes brown in color, and will no longer shine in the dark. It is in fact changed in character completely. It will no longer oxidize in the air. If it then be heated to 500° F., it becomes phosphorus again.

A CANDLE TO BURN ALL NIGHT.—When, as in the case of sickness, a dull light is wished, or when matches are mislaid, put finely powdered salt on the candle, till it reaches the black part of the wick. In this way a mild and steady light may be kept through the night by a small piece of candle.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

73,021.—IMPROVED APPARATUS FOR COLLECTING PRECIOUS METALS.—James F. McDougal, San Francisco, Cal.:

I claim, 1. A sluice containing obstructing-standards, so placed as to convert the current into eddies, substantially as described.

2. The iron standards, B, C, together with the removable copper tubes, D, or an equivalent device, constructed and arranged substantially as above specified.

3. Plugs, a, a, for raising and lowering the tubes, substantially as described.

4. Copper plates, b, b, when employed and attached to the sides of the sluices, as and for the purpose herein described.

The object of this invention is to provide a new and improved method for constructing sluices, so as to bring the gold or silver into contact with amalgamated copper surfaces, to effect a greater saving of the precious metals. This is accomplished by constructing a sluice-box in the ordinary manner, and placing within it perpendicular tubes or bars of copper in rows, in such a manner as to intercept the stream and cause it to form a succession of eddies, thereby checking the motion of any precious metal, and bringing it into contact with the surface of the copper; the tubes standing either perpendicularly or at an inclination, as may be found most convenient or efficient.

73,042.—IMPROVED DRIVING BRIDLE.—Archibald Rice and Lewis Leach, Fresno, Cal.:

We claim the combination and arrangement of the strap, a, a, with loops or pulleys, c, c, and d, d, with the reins, A, hitched to the post hook, and running through the loops or pulleys, c, c, and to the hames or saddle, substantially as described.

This invention provides a bridle, with a bit so constructed that the cheek-rein is done away with, or combined with the driving-rein, and only the two driving lines employed. To accomplish this object, the head-stall is made in the usual way, with the exception of two straps, which cross the forehead of the animal angularly above the eyes, and extend down to the rings of the bits, to which they are attached, the other ends being formed with loops. Through these loops the reins pass, the center or "hite" of which is placed in the cheek-hook of the saddle. With these reins the animal is easily managed, while he works easier than when the curb-bit is used, and is less liable to hurt in the mouth. It is self-regulating, as by simply slackening the hold, the horse will regulate the tension himself, and can readily reach his head down to eat or drink, thus obviating the necessity of alighting to uncheck, and avoiding the danger of his starting to run while doing so.

73,306.—IMPROVED ORE CONCENTRATOR.—Henry Donnelly, Virginia City, Nev.:

I claim, 1. The concave reversible shaking-tables, c, c, attached to and operating upon the opposite sides of the shaft B, together with the trough, A, substantially as described.

2. The key, c, and the spring, d, together with the arms, a, a', h, h', loosely attached to the shaft, B, for the purpose of reversing and locking the tables, substantially as specified.

The object of this invention is to provide an improved concentrator for saving gold and sulphurets. This end is accomplished by constructing two concave reversible tables, placed back to back, on the same axis, and operated so as to have a shaking motion, which serve to concentrate the gold and sulphurets upon the upper concave blanket, until it is full, when the tables are, by a simple device, reversed—the upper one going below with its load of sulphurets, which are then washed off in a tank of water; while the other table, being at the top, is filling, a sufficient amount of water being supplied to separate and wash off the sand, while the surface of the blanket retains the gold and sulphurets until it is again reversed. The sulphurets are retained by the fibers of the blanket until it is well covered,

when, without stopping the machine, the apparatus is reversed, to receive the discharge from the feeding trough. By this alteration the work is made continuous, and no stoppage is required.

73,337.—IMPROVED FINISH FOR PAINTED SURFACES.—Henry T. Payne and William Ayres, San Francisco, Cal.:

What we claim is a finish for paint, consisting of crude galena, prepared and applied substantially as described.

This invention relates to an improved finish for paint, either on the outside or inside of buildings, or for signs, and consists in substituting pulverized galena for smalt or sand which is now generally used for such finish. The galena is pulverized to the desired fineness, and applied in the same manner as smalt or sand, by being thrown against the painted surface by hand. Any surface so treated will present a brilliant finish, which may be made to imitate marble or other stone according to the degree of fineness to which it may be pulverized, etc.

RECENT INVENTIONS.

A NOVEL INVENTION—THE WAVES TO BE USED FOR PROPULSION.—Mr. W. D. Robertson, the inventor of the railroad track-laying machine, is now engaged upon another novel enterprise, which consists of an invention designed to make use of the waves for propelling vessels at sea. To accomplish this, he constructs three boats, and attaches them in any convenient and practicable manner, so that they shall float in a line. The center of the three boats should be of a tonnage about equal to both the others, and is rigged with wheels, like a steamboat, each wheel having a walking-beam, one end of which is connected with the crank of the wheel shaft. The opposite extremity of each walking-beam is connected with a compensating cam, which describes in its movement the arc of a quadrant. These cams are also connected, by a connecting-rod, with their respective boats, the one forward or the one aft the center boat. By a peculiar device, the alternate elevations and depressions of either the forward or after boat is made to move the cam, which, by its connection with its respective walking-beam, is made to operate the same so as to perform the service of the piston of an engine in turning the wheel. Every motion of the forward and after boats, however little or much, is all converted into a direct and continuous action upon the wheels. A rise or fall of either boat to the extent of one foot, is sufficient, we believe, to give the wheel with which it is connected one revolution. The machinery is so devised that the power may be regulated at will, or disconnected altogether. The boats themselves may be disconnected at a moment's notice; and as each is provided with masts and sails, they can move independently under sail. The united length of the boats being constructed for the trial is sixty-eight feet. They are all completed, and will be launched and the first trial trip made the coming week. Some six or seven thousand dollars have been expended so far in this experiment. Mr. V. Frazer is associated with Mr. Robertson in the enterprise. We hope he be present at the trial trip, and shall report the same for the information of our readers, with a more full description of the propelling machinery. We trust that Mr. Robertson's efforts to harness the waves and make them subservient to his will, may be as successful as could be wished.

ROCK DRILL HOLDER.—Mr. John Pattison, of Nevada, has invented what appears to be a very convenient and useful device, intended for holding and turning a rock drill, by the aid of which a man can strike with both hands in any direction, while he holds the drill in position and turns it, to an exact gauge, with his foot—the drill being moved at every blow. The device is exceedingly simple, and is secured in position for work by being attached to any convenient piece of timber, with a simple set screw, as a sewing-needle is attached to a lady's work-table. One important advantage connected with the use of this device is the small space in which it can be operated. It is often the case that a large amount of time is lost in preparing a place for the drill-holder, which necessity is entirely obviated by this device; as if no convenient piece of timber is already presented to which to secure the drill, it is but the work of a mo-

ment to adjust one, and by it the labor of one man is saved. The entire mechanism weighs less than twenty pounds. The drill is removed from the hole for clearing the same or changing the drill, as readily as when held by hand. The inventor has submitted it to practical tests in Nevada. Application for a patent for the invention has been made through this office.

QUICKSILVER FEEDER FOR QUARTZ MILLS. The same gentleman has invented a machine for feeding quicksilver to quartz batteries, which is operated by any simple device which may be readily connected with the cam-shaft. Great difficulty is experienced in feeding quicksilver to the battery by hand, with the proper degree of regularity, to obtain the desired benefit therefrom. The feeder is apt to be over neglectful, or he feeds too much at a time; loss is the result in either case. By this device any given amount of quicksilver can be dropped into the battery at regular intervals, according to the speed with which the battery is being run. The feeding can be varied to suit the character of the rock being worked, to the smallest desirable amount. The device is cheap, occupies but a small space, and can be set, if desirable, entirely above the stamps so as to be quite out of the way. All that the amalgamator has to do, is to fill his reservoir, and the amount of feed to the battery cannot vary or fail until the reservoir is empty. The instant the mill stops the supply of quicksilver is cut off, and put on again the instant the mill is started up. Application for a patent for this machine also has been made through this office.

Any person desiring further information with regard to these machines, or who may wish to purchase the same, should address John Pattison, Nevada, Cal.

COMBINATION STEEL RAIL.—Mr. E. P. McCarthy, of this city, has invented and has on exhibition at the Merchant's Exchange, California street, a new rail, which he terms the "Combination Steel Rail." It is in two parts; the continuous grooved chair and the rail itself. The first is of wrought iron plates, the second of steel; and the two are so laid as to reciprocally break joints. Between the chair and the rail is a thick layer of felt. The rail is forced into its place by a considerable pressure, and when down is firmly bolted to the chair. We shall describe this invention more fully at another time. Mr. McCarthy has applied for a patent through this office.

CITY TELEGRAPHING.—A plan has been adopted in Paris for the transmission of telegrams to all parts of the city every ten minutes. Boxes are placed at different points for the reception of the dispatches, and adhesive telegraph stamps, attached by the writers, may prepay them. The contents of the boxes are sent to the office of the district every ten minutes, by atmospheric tubes.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

SAN FRANCISCO HAULING CO.—Feb. 11th. Capital stock, \$100,000; 1,000 shares, \$100 each. Trustees: John Rosenfeld, Oliver Hinckley and John Maskell.

EPELEY GOLD AND SILVER MINING CO.—Feb. 12th. Capital stock, \$100,000.

THE WEATHER.—Mr. Tennent's weather gauge has shown that the night of December 27th–28th was the coldest of the present cold winter, and the coldest ever recorded by Mr. Tennent in this city. The thermometer registered twenty degrees.

DEATH OF AN INVENTOR.—Samuel Nicholson, the inventor of the pavement hearing the same name, died on the 6th ult., at the United States Hotel, in Boston, after a brief illness. He was a native of Plymouth, Mass.

YOSEMITE, AGAIN.—The Assembly has passed the Yosemite bill over the veto of Gov. Haight. This looks bad. Congress will, however, undoubtedly refuse to ratify their action.

"THE OLDEST DOCTOR IN THE WORLD." Prof. F. Verdugo, of Salamanca, Spain, died recently, aged 105 years. He had practiced medicine for eighty years.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY

For Scholars, Teachers, Lawyers all Professional Persons, and those of Common

Education, who would improve the

Eloquence and Effectiveness

of their Composition and

Manners of Address.

Price, postage paid, - - - \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PROF. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools.

To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Siet.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in my profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the application of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text-books.—James Deann.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. Hunt, A. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—J. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of valuable special pleadings and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. * * * Exactly calculated to interest. * * * It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Bouie.

A gentleman of varied learning and eloquence, who has half a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so much assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—S. F. Bulletin.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Times

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power. In short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt supplied.—S. F. Examiner.

This is an age in which the occasions are rapidly multiplying, when educated men and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, Feb. 1st: The shaft on the Morning Star lode is now down 70 ft. The pump works splendidly, keeping the water out without difficulty, and the work goes on in good shape.

Mr. T. Chalmers, the London agent who is waiting here returns from his principals, before starting up work on some extensive mining enterprises in this district, attracted by the surface indications of the recent locations made for the Monitor Consolidated Co., and the fact that actual surveys conclusively prove this to be the Boulder Hill lode, has located 1,000 ft. of the lode south from the Monitor Co's ground.

Amador County.

Dispatch, Feb. 8th: The Sulphuret mill at Sutter has been purchased by the former owner, S. S. Manor, and is now in operation, running on sulphurets obtained in that district and other places.

The sulphuret works at the Coney & Bigelow mine are now in full blast, and work to perfection. They are under the superintendence of Mr. Agrell.

Calaveras County.

Chronicle, Feb. 8th: On Saturday last we visited the Golden Gate claim and the mine owned by Paul & Co. Work is being constantly pushed forward on both claims with the most satisfactory results. In the Golden Gate claim, an incline tunnel, 400 ft. in length, has been run, and a lead of paying gravel 100 ft. in width, developed. The company have about 1,500 car loads of gravel spread in the drying yard, which they will wash as soon as it has slacked sufficiently. Should the dirt pay as well as it prospects, a mill will be erected to crush the gravel as it is taken out. The company have developed what promises to be a remunerative mine.

Paul & Co. are working a large number of hands, and taking out gravel which fairly glistens with the precious particles. The claim is worked through a tunnel 1,100 ft. in length, 900 of which extends through bed rock hard as flint. Upon breaking through into gravel, the tunnel was found to be 13 ft. above the bed of the channel, necessitating the running of an incline a distance of 75 ft.

The Cat Camp correspondent of the San Andreas Register writes as follows: There are about 80 companies at work, averaging three white men to each, and in several instances two or three Chinamen. Some few claims have been bought by Chinamen. Out of the whole 80 I think I should be quite safe in saying not more than five but are making over \$2 per day clear of all expenses, while some were making as high as \$10 per day clear to the hand. There is no great strike expected to be met with there, fair wages for a fair day's work will be the average. No gold has been found larger in one piece than 25 cents. The pay dirt is not deep; it is shallow in fact, but there are some very good hill diggings, banks say from 15 to 20 ft. Messrs. Holman & Co. are making about \$4.50 per day to the hand out of a claim they bought of two San Andreas men for \$30.

Inyo County.

Charles F. Duval writes to the Virginia Enterprise from the Cerro Gordo mines as follows: The miners in Coso are doing passably well, averaging \$5 per day to the hand; but those of Cerro Gordo are able to do much better, even with a common "baso." Had we some clay here that would stand fire, all interested in mines could make money as fast as any reasonable man could desire. There is great excitement here about some newly discovered mines, situated about fifty miles east of Coso. It is reported that they pay \$100 per day to the hand, but that the Indians have driven the miners away. Companies are forming to go and drive out the Indians. The Cerro Gordo Co. have a large amount of ore at their furnaces, but cannot work it on account of the weather, having no lumber with which to shelter their works.

Kern County.

Grass Valley National, Feb. 6th: The El Dorado and Piute mining districts, situated in the southeast corner of Kern county, have already attracted the attention of some of our Grass Valley operators in quartz mining by the richness of the gold-bearing veins found within their limits. Shafts have been already sunk to the depth of 200 ft., and the lead where now being worked is 9 ft. wide. Some of the rock from these claims yields as high as \$200 to the ton.

Mariposa County.

Gazette, Feb. 8th: From Hornitos, we have the following items: Geo. Chittenden has leased the Grimshaw vein and his quartz mill on Bear creek to J. G. Ransom & Co., late of Alpine county, for two years from March 1st.

Page, Dyer & Weber are erecting their building on the Washington vein, and will have it in readiness to receive their new mill as soon as it arrives. They have made arrangements to erect a furnace early this spring, and are going to use the chlorination process in separating the gold from the sulphurets, which are quite rich in this vein.

Wm. B. Floyd has sold to parties in San Francisco a portion of his mine in Hunter's Valley, known as the Floyd mine.

Miners about Sherlocks have been ground sluicing during the late heavy rains.

Nevada County.

Transcript, Feb. 5th: We learn that a lot of fine looking rock from the California mine is to be crushed at Palmer's mill.

Feb. 6th: On Tuesday last a rich body of ore was struck in the Pittsburg mine. About last July a break occurred in the mine, and since that time they have been running for the ledge. On Tuesday last they opened upon a body of ore, where the ledge is well defined, which has much the appearance of the quartz which was obtained from Rocky Bar. The rock appears to be better than any ever taken from the mine, and it is estimated that it will yield fully \$200 to the ton. The Pittsburg mine is what was formerly known as the Wigham mine.

Feb. 7th: The hydraulic claims on North San Juan Hill are making good returns to their owners. After the last run, the Star claims, owned by the Yuba Ditch company, cleaned up between \$8,000 and \$10,000.

The American hydraulic claims at Sebastopol, Bridgeport township, still maintain their excellent reputation. A short time since one-sixteenth was sold for \$8,000, and we understand that the last clean-up was above the average, which is about \$10,000 to the run.

Feb. 8th: Mr. Brock, who is engaged in working over old tailings under the bridge below the New York Co's mill, is making first-rate wages. He is working in the vicinity of the claims worked by Sneath & Clay some years ago.

The new works have been completed at the Star Spangled Banner mine, and fine progress is being made in the mine. They now use one engine for pumping and another for hoisting.

The great rush of water in Greenhorn creek, opposite Quaker Hill, of last month, wore down the tailings; the cessation of storms and the intense cold then shut off the water. Several companies of miners have gone to work on the tailings of the creek, and are making from \$5 to \$8 per day to the hand.

Grass Valley National, Feb. 5th: Parr, Perry & Co., near the Sugar Pine mill, on the Greenhorn road, have commenced hydraulic on their gravel claim with good success. Their ground is from 8 to 10 ft. deep, and pays from top to bottom. They have two immense flumes, each 800 ft. long, which cost about \$6,000.

Feb. 8th: Yesterday a German named Fritz Jensen picked up a piece of quartz rock back of Nigger Hill which contained gold valued at from \$10 to \$20.

Gazette, Feb. 10th: For the last three weeks the Gold Hill mill has been crushing rock from the Dromedary at the rate of 25 tons a day, which will yield some \$25 or \$30 a ton. At the present time 55 men are employed in the mine, and they are raising about 260 tons a month. The yield will be much larger when the mine is more fully opened.

EXCELSIOR.—Virginia Enterprise, Feb. 8th: It is said that the snow is now from 15 to 20 ft. deep in Meadow Lake. The only communication between the town and the outside world is by means of snow shoes. There are only some 30 or 40 persons now stopping in the town. None of the mining companies in the district are doing anything at present, except the Enterprise and Mohawk & Montreal companies. Both of these companies are working their mines vigorously.

Placer County.

Stars and Stripes, Feb. 6th: The shaft of the Fred. Mallet claim is down 50 feet, and at that depth good prospects were obtained before the winter storms set in. The shaft is now full of water. Specimens of the rock which we saw in the dump were full of sulphurets. Work on the New Mexico will be resumed soon, and the owners will make an effort to procure a small mill in the spring. This ledge furnishes quartz which yields \$16 per ton in free gold.

The Black Lead on Bald Hill has no equal in the State for richness. The ledge

is partly decomposed, and yields at the depth of 75 ft. from \$100 to \$200 per day to the hand in free, coarse gold. We saw a large lot of the gold at the Express office on Saturday last. The gold is worth nearly \$18 per ounce in the market.

Herald, Feb. 8th: There are many locations on the Black and Green Emigrant ledges, but the Green Emigrant Co. and the McGonigle, Perry & Co., on the Black Ledge, are two different and distinct mining companies. Both are very rich and being worked vigorously by their owners.

Plumas County.

Quincy National, Jan. 25th: Messrs. Jolly & Co. of Nelson Point, are moving the earth rapidly in their claims this winter, with plenty of water, which is quite a rarity for them, and they enjoy it much, as they anticipate a rich harvest of "big lumps" next summer.

Shasta County.

Courier, Feb. 8th: The Mammoth steam quartz mill, the most complete and costly mill in this county, has proved an unprofitable piece of property for its owners. The mill was first located near the main Mammoth lode, at Old Diggings, but the rock failed to pay, and the establishment was removed to the Harrison ledge, near Quartz Hill. Several runs were made on rock taken from this ledge, but the company came out in debt at the end of each run, and the mill was stopped. The company have authorized the Trustees to sell the mill for a sum sufficient to pay the company indebtedness.

Alexander Leider recently picked up a gold nugget between Horsetown and Muletown, which weighed one ounce.

Sierra County.

Downsville Messenger, Feb. 8th: It is reported that the Doole Co., near Alleghany, are taking out about 25 pounds of gold weekly—over \$5,000.

We hear that the Eagle, Slope and Gate claims are again paying well.

Siskiyou County.

Yreka Union, Feb. 1st: The cold weather which has prevailed now for over a month has suspended all mining operations, and as a consequence ready money is becoming particularly scarce. Nor is there at present any prospect that miners will be able to resume operations soon. The ground is frozen so hard that it is impracticable to wash; and owing to the very cold nights, water does not become abundant enough in the creeks for ground sluicing.

ARIZONA.

Prescott Miner, Jan. 11th: F. H. Wunderlich, recently from Big Bug district, informs us that quite a number of men are engaged in running a tunnel upon the Eugenie lode. The several strata of which the ledge is composed are as follows: Next the foot wall there are between 18 in. and two ft. of solid quartz, mixed with small, neatly formed sulphurets of copper; next to this stratum, there is the same thickness of decomposed copper-stained rock; then there are fully two feet of solid, bluish rock, which is also well mixed with sulphurets, and which breaks out in large, square pieces. We have seen a piece of this sulphuret rock, and it looked to us as though it would pay well, if properly treated.

A drift, 20 ft. in length, has been run into the Galena ledge, at a depth of 70 ft., which opened up a body of beautiful sulphuret ore, $\frac{3}{4}$ ft. thick. There is a bluish-black rock in this ledge that has assayed \$500 per ton.

Placer mining, on account of an insufficient supply of water, is at a stand-still.

Poland & Pearson, in Walker's district, recently worked five tons from the Spur lode. The clean up established the fact that the Spur is a good lode.

McCrackin is hauling rock from the Pay Streak, a new ledge.

Watson, Fredericks and Marsh, are taking rock out of the Shamrock lode.

A French is burrowing in the Tie-Tie. The Thunderbolt mill is running upon Shamrock and Tie-Tie ores.

Some placer mining is being done on the bars of the creek, but there is scarcely enough water for that purpose, or for running the water arastras.

Young & Roddick, in Hassayampa district, are down 46 ft. upon the Chanco lode. The rock looks first rate and shows native silver. Joe Young, one of the owners, got, recently, out of nine pounds of rock, nine ozs. of amalgam.

The Chase lode continues to yield plenty of rich rock. Work is progressing steadily.

Mr. Reed started the Sterling mill on Wednesday evening, upon a small lot of Sterling tailings.

A party of Gormans, who have been engaged in placer mining on the Hassayampa, recently struck, while working in the bed of that stream, a large ledge of finely grained

plumosa. After manipulating and reducing the ore, the amalgam is worth \$5 per oz.

Frank Alters has lately found a big, rich quartz ledge, and is now at work upon it.

We were recently shown by Mr. Sholton, of Walker's district, a lot of beautiful specimens of quartz and gold, which were found by him recently in that district. The quartz which holds the gold is bluish-white. One of the pieces was more than half gold; the others were also very rich. The ledge from which the pieces were slid or washed has not yet been found, but parties are now prospecting for it.

COLORADO.

Central City Register, Jan. 21st: The cold spell seems to have passed for the present, and the weather has settled into the bright and beautiful, solidly and steadily cool. The Briggs, and Smith & Parmelee mines experience no trouble as yet from the stoppage of the Black Hawk, and miners manage to keep all the custom mills heretofore employed, running, together with a portion, if not all of the Black Hawk Co's mill. The rock from all the mines working at present is paying as well or better than before for several years.

Mr. Ed. C. Parmelee showed us yesterday a sample of ore weighing several pounds, from the Munsell lode, near the Equator, above Georgetown; also 12½ ozs. of pure silver, taken from 18 lbs. of the ore by Stowell & Litchfield, of Georgetown, assaying at the rate of \$1,800 per ton.

Mr. Conlee's last week's clean up was 150 ounces.

Mr. Conleo has been running 40 stamps of the Black Hawk Co's mill since they stopped work, and the company have been running the other 20 on their ore from the Bobtail mine.

The water is now 250 ft. deep in the Black Hawk Gregory mine, and rising very slowly. The Smith & Parmelee have made arrangements which they think will take care of it if it shall run over on them. The latter company are getting out fine ore in large blocks from their pump-shaft.

A gentleman gives us the following items in reference to the quality of the ore from a certain lode on Quartz Hill. He took four samples to New York last winter and submitted them to Mr. Dunning, of the U. S. Assay Office, who assayed them, No. 1 yielding at the rate of \$88, No. 2, \$857, No. 3, \$4,955, No. 4, \$11,494 per ton, \$2,000 of the last result being silver. Last week, \$20 in gold was taken from 20 lbs. of the best of this ore, sulphuret; and again, \$103 was taken from 400 lbs. of it, by the Kenyon process. The vein of ore whence it was taken was 18 in. wide, the very richest stratum about three in.

Denver News, Jan. 22d: Mr. J. J. Hoover exhibited to us this morning some specimens from the Five-Twenty lode in California Gulch, Lake county. The specimens taken from this lode, are among the richest we have ever seen, and prove its immense wealth. The rock is so soft that no blasting is necessary, but can be taken out with picks and shovels. They have about 50 cords of quartz on hand, which they have just taken out.

DACOTAH.

The Chicago Republican gives the following extracts from a letter dated "New Gold Mines, Dacotah Territory, Jan. 1st": Out of the Creso lode, the first discovered, men have made as high as \$130 per day with a hand mortar. Four tons of rock hauled to Springfield, gave a result of \$28,000; but at present the company are paying \$200 per ton to have the quartz hauled 500 miles to be crushed, with a result of from \$2,000 to \$4,000 per ton. In three or four cases rock which has been pounded in a hand mortar has yielded from \$10 to \$12 to the pound of ore.

The lodes are all well defined, found mostly in the slate or on the break between the slate and granite. The Atlantic can be traced and crops out for between four and five miles, is from five to 15 ft. wide, and assays \$197 per ton, with wall rocks of slate, inclines to the north, 32°.

The Mammoth is from four to 12 ft. wide, rises above the surface for some four miles, at places only a few inches and again to the height of three or four feet; prospects well, and has the appearance of being just as good a lode as the Atlantic.

Miner's Delight lode is 15 in. wide on the top, and at the depth of 12 ft. it is three ft. wide, shows for some 400 ft. in length. Men at work on rock from this mine, with a hand mortar, make from \$4 to \$15 per day. An assay of average rock yielded \$800 per ton.

The Almira is visible for a mile, about eight ft. wide and prospects well.

The Lone Star State, $\frac{3}{4}$ ft. wide, shows fine gold in abundance.

The Pacific is nearly five miles in length, from 10 to 20 ft. in width, prospects the entire length and width. The ore will yield from \$150 to \$200 per ton.

The Great Republic is from four to 12 ft. wide, crops out for 5,000 ft. and prospects very rich.

Greek Slave is nine ft. in width, shows for 3,000 ft. in length, and prospects splendidly.

The Amphictyon is five ft. wide, shows 7,000 ft. and cannot probably be equalled in richness by any gold mine ever discovered. Some 150 lodes have been located in a circle of six by fifteen miles, while the great mineral belt in which these mines are found extends from 30 to 60 miles in width, from east to west, and .30 miles from north to south, but only a small portion has been prospected, and that only run over. There have been three gulches found which prospect from three to thirty cts. to the pan, with from two to five ft. of pay, plenty of water, and no stripping. In the Cresco Gulch, during the fall, as high as \$30 per day to the man was made. The prospects are that very rich placer mines will be found during the spring and early in the summer; there are probably not over 25 holes in all this country sunk to the bedrock. Reliable reports which have just reached us bring tidings that a very rich gulch has just been discovered 20 miles east of the South Pass. The gulch is reported to be five miles in length, plenty of water, pay nine ft., and that all the way down good for from an ounce to \$30 per day to the hand; also rich diggings are reported as just discovered at Devil's Gate, on the Sweetwater, where gold has been found for years, but never in paying quantities.

Virginia Enterprise, Feb. 4th: Parties are leaving almost daily for the Sweetwater mines.

The Grass Valley Union hears of several parties being made up to go to the Sweetwater mines in the spring. A general stampede to that region is expected.

IDAHO.

Owyhee Avalanche, Feb. 1st: Work is going on lively at the Oro Fino. In the south drift the ledge is now five ft. wide and getting richer. Owing to the want of shoes and dies the Morning Star mill is not running at present, but the Cosmos mill is constantly running on Oro Fino ore.

Work is being vigorously pushed forward night and day on the Ida Elmore, and ore of marvelous richness is being taken out. It is estimated that each load of quartz hauled from this mine, yields over \$1,000. Gold can be plainly seen in almost any portion of the rock—beside it contains large quantities of silver.

We noticed this week in the ore house at the Golden Chariot mine a pile of ore all sparkling with gold and streaked with silver. Work goes on night and day, and the ledge appears to become richer the deeper it is worked.

The Rapidan is being worked, as is also the Omega, two ledges discovered late in the fall. The boys are getting ore rich in gold and silver from both of these mines.

The Calaveras mine prospects well, and preparations are being made to work it on an extensive scale.

A number of tons of ore have been worked from the Allison mine. We are not at liberty to state the yield.

Yesterday, Wells, Fargo & Co. shipped below \$40,000 in bullion. During the last month \$150,000 have been shipped from Owyhee.

NEVADA.

Black Rock.

Amador Ledger, Feb. 8th: The Black Rock mines, of which so much has been said, are now considered worthless. Every expedient has been exhausted in the endeavor to make them pungle, and many shrewd, honest quartz men have lost their money. Among others our most worthy and old time friend Uncle John Atchison. Comes back to Amador, Uncle John, and you shall have a mine that won't take a mine to work it—no eyesnuck in it.

Reese River.

Reese River Reveille, Jan. 29th: Several mines of Lander Hill are just now producing ore of a higher quality than usual. This is especially true of the Magnolia, Florida, North Star, and Troy. We were shown samples last night of the ore obtained from the lower workings of the Magnolia, which was a sulphuret of the simplest combination and rich in silver.

Feb. 1st: The lack of salt has caused most of the mills to close operations until the weather permits of its being procured. This cause closed the Metacom mill on the first of the month, and compelled the five 20-stamp mill of the Twin River Co. to lie idle for three-fourths of the month. The mill of the Centenary Co. in the Newark district is now closed, or will be shortly, for the same reason.

The Buckeye mine, in Summit canyon, produced the most beautiful specimens of

native silver, in flakes, threads, and moss-like bunches, that have yet been exhibited in this region. Besides native silver, the pure sulphuret of silver is obtained from the mine. We saw last evening very choice specimens of this black silver; they were procured in the upper tunnel of the mine, and were almost the pure sulphuret of silver. Captain Kidd, the Superintendent of the company, told us that he worked a specimen of this black silver of the weight of 3½ ounces, and obtained from it 2½ ounces of silver. The Buckeye mine is apparently a deposit, and the ore occurs regularly in irregular bunches.

Feb. 4th: We saw to-day a bar of bullion valued at \$233.81, and 937 fine, which was produced from 3,000 pounds of ore from the Silver Circle district. The lot of ore was worked by J. R. Murphy at the California mill.

Yesterday afternoon 14,000 ounces of crude bullion were brought into the city from the mill of the Centenary Co., Newark district. The bullion was produced by 14 days' run of the mill.

Feb. 6th: From a party recently returned from Palmetto district, we learn that the snow was 18 inches deep. The Kentucky ledge is from 6 to 9 ft. thick, and carries a compact mass of ore of very simple combination. Tests place the average yield of the ore at from \$75 to \$100 per ton.

Feb. 7th: The mill of the Centenary Co. was destroyed by fire on the 5th inst. The machinery received little or no damage. The engine, battery and pans are standing apparently uninjured. The entire loss is estimated at from \$15,000 to \$20,000.

In the vertical shaft of the Plymouth Co. in Lander Hill, a ledge was struck yesterday at the depth of 247 ft. It is believed to be one of the company's ledges, and exhibits six inches thick of fine looking ore. Silver Bend Reporter, Jan. 25th: The New York and South Twin River Co. have purchased several promising mines in Reveille district, and intend erecting a 10-stamp mill in the spring.

The Combination Co.'s 40-stamp mill will commence work during the coming week.

Messrs. Leon & Mullen have purchased a mill-site at the lower end of town and contemplate the erection of a small mill, early in the coming spring, for the purpose of working the ore of their Eldorado South mine, which continues to develop to their entire satisfaction.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Virginia Enterprise, Feb. 4th: There is at present but about 150 ft. of water in the Imperial-Empire shaft. As soon as this water is hauled out the guides for the cage will be put in and the work of drifting will be commenced at the depth of 900 ft.

The amount of bullion shipped from the office of Wells, Fargo & Co. at Silver City, for the month of January, was \$12,000.

Feb. 5th: There has been a marked improvement in the character of ore from the Lady Bryan mine within the last two weeks. At a point about the center of the lode the ore is of more than ordinary richness. Assays from it give as high as \$260 and \$300 per ton. At or near this point they have sunk a winze down some 20 ft., in order to test whether it would hold good in going down; besides this experiment, at a distance in the tunnel run in early days from the cañon, some 50 ft., they commenced a drift north and south on the lode and found the ore to be of equally as good character as that found in the face of the croppings. This ore is reduced at the DeLand mill. Thall & Co. have returned the company a bar, containing \$2,200 from the settlers alone, and it is almost positive that the pans will clean up more than the settlers. According to the closest calculation, the ore will yield over \$33 per ton.

Feb. 6th: Work will be resumed upon the Sacramento and several other mines, situated on Cedar Hill, as soon as the snow disappears from the roads leading up to the various claims.

A deposit of good ore, of considerable extent, has lately been found in the Milton mine, between this city and Gold Hill.

Feb. 8th: An assessment of \$10 per share was levied on the Sierra Nevada claim February 5th.

Several mills on Gold Cañon that were lying idle, during the stormy weather prevailing for the past two or three months, for want of ore have again resumed operations.

Wells, Fargo & Co. shipped from their office in this city during the past week, 2,862 lbs. of assayed bullion, valued at \$53,410.76.

(Continued on Page 106.)

Salt Spring Valley and the Adjacent Region in Calaveras County.

(Read before the California Academy of Natural Sciences, December 16, 1887, by W. A. GOODYEAR, Ph. B., Civil and Mining Engineer.)

(Continued from Page 82.)

It has been already remarked, that this zone or belt of surface decomposition, in which the "Quail Hill" and other similar mines occur, may be traced with considerable constancy for at least fifteen or eighteen miles, and that it is not improbable that it is much longer than this. We cannot, however, infer from our present knowledge that the decomposed or "calico" rock is continuous throughout the belt, or even for any considerable portion of its length. On the contrary, its distribution within the belt appears capricious and local, i. e., it seems to occur in more or less detached and isolated masses, which vary largely in form and size, and are irregular and indefinite in outline; so that little more can be predicated of their occurrence in general, than that they are mostly confined within a comparatively narrow belt, and that their longest dimension exhibits a general tendency to approximate parallelism with the axis of the belt, and the stratification of the inclosing country. Sometimes,—as, for instance, along the northeastern side of the Quail Hill formation,—this tendency is so strongly developed, and the passage from the decomposed to the undecomposed rock is so rapid, as to form for some little distance a tolerably straight and well defined "wall" or line of demarcation, parallel, or nearly so, with the stratification of the country. But the change or passage from the decomposed or "calico" rock to the surrounding undecomposed country, though sometimes rapid is always gradual, so far as I have seen; and though we cannot as yet speak much from underground explorations, the surface appearances throughout the country would indicate decidedly that so regular a line of demarcation as this at Quail Hill is the exception, and not the rule. The southwestern limit of the decomposed mass of Quail Hill has been found at several points; but here the change from the decomposed to the undecomposed rock is not so rapid; and though the explorations here, being shallow and limited, are insufficient to determine this point with certainty, it is not probable that any such regularity of demarcation exists here as upon the opposite side. Most of the "calico rock" of this belt still retains distinctly the structure of the undecomposed rock from which it was formed. The crystalline hornblende rock is thus seen to have been largely altered by the decomposing agency, and even the hornstone, which lay in its track, seems to have been more or less affected by it. The decomposition has been purely an oxidation, accompanied by such mechanical and chemical changes as filtering mineral waters might produce. It is probably superficial, both in origin and character, extending to no great depth, although the main level at Quail Hill is nearly 120 feet beneath the summit of the hill, and the decomposition of most of the rock at this depth, so far as exploration has gone, is as perfect as at any higher level.

It is certainly long subsequent in date to the metamorphism of the surrounding country, and is unquestionably largely due to the action of the products of the oxidation of metallic sulphurets (chiefly those of iron and copper) which were originally distributed through the rock. At the same time it is not easy to account for the whole of it in this way alone, since, at certain localities, undecomposed sulphurets are seen near the surface, and in rock which is apparently much more permeable to atmospheric influences than was much of that which has been more deeply decomposed; and, again, much of the decomposed rock, though retaining well its original structure, shows far too little traces of sulphurets to readily account for so general and thorough a decomposition as has taken place. It is all, indeed, more or less colored by oxide of iron, but much of it is not deeply colored, and the undecomposed hornblende rock itself, in the absence of all sulphurets, con-

tains sufficient iron in the state of protoxide to impart a strong coloring when the rock is decomposed and the iron passes to the state of sesquioxide. Much of the iron originally present has undoubtedly been removed in a soluble form, as sulphate, etc. But in rock which preserves its original structure, as well as most of this does, pyrites, if originally present, would have left traces of its existence in the form of casts or cavities in the decomposed mass, which might or might not have been filled with ferric oxide or other matter. In certain localities the decomposed rock is in fact filled with such cavities, often cubical in form, attesting the former presence of large quantities of disseminated sulphurets. But in other localities they are few and far between, and here accordingly the decomposition can hardly be supposed to have been due to the local presence of sulphurets alone.

The exact methods by which the general and local decomposition has been effected, and those by which the rock was originally impregnated with metallic ores,—as well as the manner in which certain substances, as baryta, now found as sulphate, and true perphyry, now found as kaolin or lithomarge, have found their present situation in the belt in question,—all these would possess both interest and importance in a high degree, could they be more definitely known. Such questions, however, cannot be answered with certainty, and their discussion here would lead us too far into the doubtful realm of chemical geology.

But whatever may have been the agencies at work, it is evident that there is nothing in all this to remind us of a true vein formation. It appears that the zone in question is neither a vein, nor, generally speaking, a system of veins. On the other hand, it possesses emphatically, in general, the characteristics of what the Germans style an impregnation;—an impregnation, indeed, which exhibits a certain regularity as being mostly confined within a narrow zone, and stretching through a considerable extent of country, but which within these limits shows the greatest irregularity of form and much variety of character. Veins of quartz occur here and there within the belt; but they are not more frequent here than elsewhere, and their occurrence has probably little or no direct connection with the peculiar character of the belt itself. There is very little that deserves the name of quartz at Quail Hill, though much of the surface is pretty highly silicious in character.

The impregnation of the rock with metallic sulphurets, particularly with sulphurets containing copper, has in certain localities been sufficiently powerful and concentrated to assume, in greater or less degree, the characteristics of segregated veins of limited extent. This has been the case at the Napoleon mine, and also at Quail Hill, where there is, or was, a band of oxidized ores of copper traversing the decomposed rock in a direction parallel with the general stratification. This band consisted chiefly of the green and blue carbonates of copper mingled with ferruginous and earthy matter, and accompanied by harytes. The last named mineral, so common a veinstone in other parts of the world, but hitherto so rare in California, occurs here in considerable quantity. Its form is granular compact, sometimes quite pure, but usually contaminated and intermingled with other matters. Crystallized specimens of it have not been found here to my knowledge. It is hardly probable that the harytes itself contains either gold or silver; yet it certainly occurs here in most intimate contact with both, as I have seen respectable particles of gold in place upon the immediate surface of compact specimens of harytes,—and a sample of heavy concentrated haryte sand from the tailings of the mill, of sufficient fineness to pass through a sieve of 100 holes to the linear inch, yielded to the assay over \$11 per ton in gold and silver.

The thickness of the copper band varied from one to three or four feet. Its outlines were indefinite, and its original characteristics of form, etc., much obscured by the complete decomposition both of itself and the surrounding rock. It was without doubt originally a segregated mass of sulphurets; and though it seems now to have nearly or quite run out and disappeared, it may be found to come in again, as such, in depth, unaltered below the line of surface decomposition.

Other hands of similar character may perhaps exist in the yet undeveloped portions of the mine. But the great mass of decomposed material which forms Quail Hill as a whole, retaining as it does to so great an extent its original structure of the country rock from which it was formed, can in no proper sense be called a vein; although its extent, when considered as a repository of the precious metals, is something far transcending this size of ordinary veins.

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office, Jan. 11, 1866.

Mr. C. T. Roney is our duly authorized agent for Sacramento County, Nov. 29, 1867.

Dr. L. G. Yates is our duly authorized traveling agent, July 6, 1867.

Mr. A. B. Butler is a duly authorized travelling agent for this paper, July 15, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana, Aug. 17, Nov. 26, 1867.

OUR NEW YORK AGENCY.—Mr. M. A. LATHROP, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No. 726 Broadway, for the present. Nov. 26, 1867.

San Francisco:

Saturday Morning, Feb. 15, 1868.

Notices to Correspondents.

A CORRESPONDENT, whose signature we are unable to decipher, sends us the following query: "I have a 36-inch engine with a 12-inch bore, which performs a certain amount of labor by making sixty revolutions per minute, and cuts off the steam after the piston travels twelve inches. Now, if I run the engine forty revolutions per minute, and cut off at eighteen inches, will it perform the same labor with the same economy in fuel?"

Reply.—Your engine, when making forty revolutions per minute and cutting off at eighteen inches, will give, with the same initial pressure of steam, eighty per cent. of the power that it would when making sixty revolutions per minute, and cutting off at twelve inches from the commencement of the stroke; and will consume the same amount of fuel. To perform the same amount of duty, when cutting off at eighteen inches, your engine will require to make forty-nine and one-half revolutions per minute, approximately, and consume, say twenty-three per cent. more fuel. The above statement does not take into consideration the clearances, steam passages, the manner of cutting off, or how the cylinder is conditioned for the prevention of radiation; all of which may modify the result. We expect, judging from the condition in which cut-off engines are generally found, that the duty when running at forty revolutions and cutting off at eighteen inches, will be in excess of what we have shown.

PROSPECTOR, Grass Valley.—The National Mineral Land Law requires that all locators of claims under that law, shall be made subject "to the local customs or the rules of miners, in the several mining districts," so far as such laws are not in conflict with the general laws of the United States; provided, however, "that no location hereafter made shall exceed two hundred feet in length along the vein, for each locator, with an additional claim for discovery to the discoverer." If the local laws of a district limit a claim to one hundred feet, the National law confines the locators in such district to the same limits. We have for sale at this office (price 25 cts.) all the forms and blanks necessary for use by persons who wish to avail themselves of the provisions of this law.

X. Y. Z.—Water is most effectually freed from atmospheric air, or other gases, as well as from all other foreign substances, by freezing. This is seen by the air bubbles formed in ice. In consequence of this property, it is a frequent practice with the wealthier Russians to expose wine to intense cold, so that the alcohol and flavoring matters present become separated from the crystallized water, and an intensified cordial is thus obtained. Ice so formed when melted is found to be free from air, if melted out of contact with the atmosphere, and may be heated without ebullition to nearly 300°, when in place of boiling it explodes! Many consider that the explosion of boilers in many cases occur from a similar cause.

EXPECTED ARRIVAL.—The steamer Great Republic sailed from Hongkong, for this port, on the 17th of January, and will be due here to-morrow or Monday.

"Joule's Equivalent"—What is it?

As Science advances, doctrines which served, each in its turn, a good purpose, and which were sufficient for their day and generation, are successively abandoned for others which more fully meet the requirements of accumulating demonstrated truths, and more fully satisfy the maturing intellect of the age. Thus, in the course of the researches into the nature of heat, the hypothesis of caloric, which was taught to our grandfathers, took the place of the older phlogiston. The caloric doctrine is now itself found wanting. Heat is no longer material; it is simply a "mode of motion." In other words, it is a form of force. The doctrine of the day is that force is indestructible; and that all modes or forms of force are mutually convertible. Heat, light, electricity, magnetism, mechanical motion, chemical action, gravitation, are but modes of exhibition of one and the same thing, viz: force. A definite quantity of each can be converted into a definite quantity of either of the others; and these again may be reconverted into the first. Thus, the chemical union, during combustion, of a given amount of carbon with a given amount of oxygen, produces a given amount of heat. This may be made, through the medium of machinery, to produce a given amount of mechanical force or motion. Of this amount of force, a portion is reconverted at once into heat, by the friction of the machinery. The remainder may be employed in raising a weight to a height in falling from which it strikes the earth with sufficient force to generate at once an amount of heat equal to the remainder of the original quantity. Gravitation, or the attraction of matter for matter, produces heat by the sudden meeting of masses; not,—as the caloric doctrine would explain, by setting free the "latent heat" which occupied the space between the particles of those masses,—but by converting the motion of the masses into a motion of their particles. This motion of particles is communicated to the surrounding particles of air, and although not lost, it ceases to be evident to the senses, as the equilibrium in temperature becomes restored. Thus no force is annihilated. The amount then, in the universe, is always the same; it varies only in form; and the various forms being convertible one into another, a definite amount bears a definite relation to each of the others,—in other words, has its equivalent in each.

The meaning of the expression, "mechanical equivalent of heat," will now be apparent. It is the amount of mechanical work necessary to produce a sufficient amount of heat to raise the temperature of one pound of water one degree of Fahrenheit;—this one pound of water raised one degree being taken as the unit of heat. This may be done by friction, or by percussion. Or, what is essentially the same thing, it is the amount of work necessary to raise one pound to a height in falling from which it would generate sufficient heat to raise one pound of water one degree in temperature. Or, again, it is the height, in feet, from which a weight of one pound must fall, to raise one pound of water one degree. One pound one foot, is the unit of work, as one pound one degree is the unit of heat. The unit of work is termed a foot-pound.

Dr. J. P. Joule, of Manchester, England, after long and careful experimentation, determined, about the year 1845, upon 772 as the number which shows the relation between work and heat. That is to say,—determined that 772 units of force were equivalent to, or would produce, one unit of heat. The fall of a weight of one pound through 772 feet, or, conversely, of 772 pounds through one foot, will produce sufficient heat to raise the temperature of one pound of water one degree of Fahrenheit. The mechanical equivalent of heat, then, is 772 foot-pounds. It is perhaps unnecessary to remark, that the figures would be different, if

the Centigrade, or any other thermometrical scale than that of Fahrenheit, were used. The determination of this point is considered the corner stone of the edifice which is being erected upon the new philosophy of force as a foundation; and as Dr. Joule is esteemed the one among the investigators of the subject who has reduced it to the greatest nicety, it has been called "Joule's equivalent." It is designated by the sign J.

Before proceeding to describe the manner in which Dr. Joule conducted his experiments, it is proper to mention the name of the man who was the pioneer in this new field;—and to whom, more than to any other, science is indebted for the opening up of this splendid generalization. The greatest minds are those who, with the quick insight of genius, perceive the fallacies of generally received doctrines, and lead off in opposition to the scientific belief of their time. To a Yankee boy belongs the credit here.

Benjamin Thompson, afterwards known as Count Rumford, was born in Woburn, Mass, in 1753. When quite a young man, he taught school in Concord, N. H., then the village of Rumford. At the commencement of the Revolutionary war, being charged with toryism, he left the country, and went to Europe. His talents soon secured him a government position, and in due time he was knighted. In 1784, he entered the service of the Elector of Bavaria. He made himself conspicuous by the reforms of various kinds,—military, economical and social,—which he accomplished; and for his valuable services was made Count of the Empire. He selected as his title the name of the little New England village aforesaid, and from that time was known as Count Rumford. In 1798 he returned to England; and having received a formal invitation from the American Government to return to his native land, was about to do so;—but becoming engaged in the work of founding the Royal Institution of England, he abandoned the idea. He afterwards went to France; became one of the eight foreign associates of the Academy of Sciences; and died in that country in 1814.

While superintending the arsenal at Munich, the great amount of heat generated in the boring of cannon attracted his attention. He soon came to the conclusion that the theory of "latent heat" would not account for the facts; and accordingly commenced a series of experiments upon the subject. A large blunt steel borer was made to press upon the bottom of a cavity in the end of a metallic cylinder, continuously revolving in a box of water. The temperature of the water gradually increased;—and in two and a half hours it actually boiled. His delight thereat was unbounded; the source of the heat generated by friction was evidently inexhaustible; that heat could not, therefore, be material; he pronounced it "motion!" The days of "caloric" were ended. He continued his experiments until he reached a result very near to that at which Joule, fifty years afterward, finally arrived. The intervening generation looked with distrust upon the innovation. But the seed was sown; and time only was wanting to complete its germination. Without the knowledge of each other, several scientific men became meanwhile engaged at the same time in experimenting; and the tender plant at last emerged from the soil of doubt, and thenceforth steadily advanced towards its present triumphant blossoming.

Joule's experiments were essentially the following out of those of Rumford; but he varied them with great ingenuity. He caused a paddle-wheel of brass or iron to revolve in a water bath, by means of a weight like that of a clock. The gradual descent of this weight from a certain height of course generates the same amount of mechanical force, on the whole, as if it fell from that height; and this again is equal to the mechanical force expended in winding

up the weight, or in raising it from the ground to that height by any other means. The friction of the paddle-wheel raised the temperature of the water in which it was immersed; and the amount of that increase of temperature was measured by a delicate thermometer. He employed in a similar manner baths of oil, of air, and of mercury. He prepared also an apparatus in which air was condensed by mechanical force,—the amount of which force was known. The condensing apparatus being immersed in water, the change of temperature of that water, as ascertained by the thermometer, would give the amount of heat produced by the mechanical force aforesaid. He also made an electro-magnet to revolve with a definite velocity between the poles of a powerful magnet immersed in water,—thereby raising the temperature of the water to a definite degree. In short, his experiments were varied in every possible manner, and were of such delicacy, that in many cases he noted changes as slight as the one-thousandth part of one degree of Fahrenheit's scale. We have not space to go minutely into the description of these experiments; we have already given their result, and the figures fixed by him after seven years' devotion to the subject.

As we have said, the determination of this point is a most important step in that new philosophy which is leading the present generation onward to such magnificent conclusions. It virtually establishes the truth of that philosophy; and gives us a standpoint from which we can look around upon a field of view immensely enlarged,—and can grasp, with ease, truths which before were beyond our reach. It prepares us to learn that *our very existence is dependent upon mechanical motion*. Do we realize the stupendous thought that the heat of the sun itself is probably maintained by the plunging into it of more than one hundred billions of tons of asteroids every minute? The heat which is generated by the contact of such immense masses moving with such tremendous velocity, is far beyond that produced by the intensest chemical action. It is this "wreck of matter and crush of worlds,"—this melting and dissolving of the elements "with fervent heat,"—that supplies heat and light and life to those orbs which yet remain. Their time is not yet come. It is the mechanical effect of clashing masses, that is the grand ultimate fact of the material Universe. That fact, however, could be,—for us,—hypothesis only, but for the conception and determination of the MECHANICAL EQUIVALENT OF HEAT.

THE NEW BLASTING POWDER.—INTERESTING EXPERIMENTS.—A large number of scientific and other gentlemen interested in blasting powder experiments, went over to Lime Point, yesterday, on board the steam tug *Gothia*, to witness a series of experiments with the new German blasting powder, the manufacture of which is about to be introduced into this city by a company of capitalists recently organized for that purpose. A large number of experiments were tried in the presence of the company, the first of which consisted in charging two 32-pound cannon balls with the powder which was placed in three-quarter-inch holes drilled to the depth of three inches into the solid iron; the powder was loosely tamped by hand, with a stick. The explosion burst the solid iron into innumerable fragments—a feat which it would have been impossible to accomplish with ordinary powder. Quite a number of other experiments were tried in different kinds of rock, most of which, however, was unsuitable to show the superiority of this powder, which is more particularly calculated to act upon very hard, compact rock. We have no space to-day to enter into a detail of what appears to be the advantages of this new blasting agent. We can merely say here that it is designed to become a most powerful and superior explosive agent. It appears to possess all the acknowledged advantages of nitro-glycerine combined, so far as is yet known, with a far greater degree of safety from accident than ordinary gunpowder.

Second Trial of the Steam Plow.

Messrs. Coffin & Standish submitted their steam plow to a second trial on Thursday of last week. A large number of gentlemen interested in agriculture and machinery, and others who were interested generally in all improvements tending to develop the resources of our State, were present on this occasion. Some little improvements have been introduced since the first trial, which worked very satisfactorily; and this second trial proved quite as much of a success as the first. No one who has seen the machine in operation, so far as we have heard, express any doubt as to its success—especially upon ground free from heavy stones and roots. No other implement was ever put into the ground which does its work so effectually and thoroughly as does this. Experience in farming everywhere goes to show that a thorough pulverization adds greatly to the yield of grain per acre. This advantage alone which it possesses over ordinary plows, considering the immense extent of ground which it will prepare each season, will soon pay for its cost. A thorough turning over, stirring up, and pulverization of the soil, enables the grain to secure all the nutriment which it needs, provided such nutriment is contained in the ground. Soil that is left coarse and lumpy, as it usually is after ordinary cultivation, cannot supply the growing and maturing grain with the proper food for its healthy sustenance.

Experience will no doubt enable the inventor to add still further improvements from time to time, as necessity or convenience may call for them. No piece of machinery ever sprang at once into full and complete perfection. Mr. Coffin is just the man to follow up the work so auspiciously begun; and no country can produce a better mechanic to meet any exigencies which may arise than is found in Mr. Standish.

Arrangements have already been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY to secure patents for the invention in all the principal countries of Europe, and their manufacture will be commenced forthwith. Half a dozen or more of these plows could be sold immediately, at almost any price, if they were ready, upon the strength of the trials already made. Preparations for the manufacture of such machinery will require considerable time and a large amount of capital. We are not advised as to what will be their cost; but we presume they cannot be built for less than from six to ten thousand dollars. What a triumph it will be for California to furnish the world with the first effective and practical locomotive steam plow—one that will perform its work more completely than any heretofore devised, and which will plow, sow and cover, at one operation, from forty to fifty acres per day! One other important advantage of this plow is, that it will put in good condition ground which is so wet as to be utterly impracticable to the work of any other plow. It does not turn the wet soil up in lumps or big flakes, no matter how wet the soil is, if it is not so plastic as to run. It cuts it up into fine bits—it mimes it when wet, and powders it when dry. Speed the plow!

PSYCHOLOGY in connection with electricity as a curative agent, is the subject of a course of lectures in progress of delivery every Wednesday evening at Dashaway Hall, in this city, by Drs. Sparks and Benton. Owing to the close relation of the mental to the physical, and the mutual dependence of the one upon the other, it is claimed that the influence over the mind of the patient by the Psychologist gives him a lever of power for sanative purposes, which in many instances seems truly wonderful. As the subject is in itself somewhat novel and interesting, and the lectures are followed by experiments upon persons present in the audience, they cannot fail to afford both amusement and instruction, while the fee for admittance is merely nominal and within the reach of all.

Float Batteries.

"Float batteries," as they are called, are now being quite generally introduced into most of our principal quartz mining districts. These batteries are so called from the fact that the stamping is done under water, and the pulverized material discharged by the simple overflowing of the water. In order to give our readers, who may not be familiar with this description of battery, a clear idea of the same, we give herewith a rough outline of one.

In the figure, A represents a solid plank, about the thickness and depth of the usual screen frame. B represents a screen of No. 18 or 20 wire, about three inches wide, and extending entirely across the front of the battery. C represents the lower part of a stamp, when up and ready to drop. The different degrees of fineness to which it may be desirable to reduce the rock is regulated by the elevation of the plank A.

As the water stands at a level with the bottom of the screen, it will be seen that the stamp is never lifted entirely out of the water; by this arrangement the splashing and forcing of the pulp through the meshes of the screen are avoided, the discharge consisting only of such portions of the rock as are crushed sufficiently fine to float over the top of the battery. The narrow screens that are used, are employed merely to arrest any large particles of quartz which may be thrown outwards by the blows of the stamps with sufficient momentum to rise above the surface of the water.

This description of battery was first introduced into use about three years ago by Mr. John Pattison, of Nevada, and, we believe, is a device of his own which he has given to the world. Wherever it has been tried, so far as we have heard, it has given good satisfaction. The secret of success in working consists in short rapid strokes—seventy to eighty per minute—considerably faster than stamps are ordinarily run.

PUTNAM FOR FEBRUARY.—H. H. Bancroft & Co., the publishers of this magazine for the Pacific Coast, have sent us a copy of the issue for the present month. It contains an interesting biographical sketch of Fitz-Greene Halleck, with an excellent portrait of the poet, engraved by Charles Burt from an original drawing by Greenough. The story, "Too True," increases in interest. It is really, as it claims to be, "an American story of to-day." Perhaps nowhere but in New York and vicinity could the material for its characters be found. In that region, the vulgar nabob of shoddy is often seen side by side with the quiet gentleman of moderate income. The latest translators of Dante are compared and contrasted in an interesting article. We have not space to mention all the good things in this number.

PROGRESS OF THE CENTRAL PACIFIC RAILROAD.—A correspondent of the *Bulletin*, writing from Cisco, February 6th, says: The road is now finished to the summit, and with a single break of about five miles at the lower side of Donner Lake, it is also complete to a point 24 miles down the Truckee, in Nevada. This line of five miles is graded, and by the first day of June the connection will be made. At the same time that the five miles is being put in working order the track will be laid from the point on the Truckee river to a point still farther on, where the road approaches nearest to Virginia City. The first train which crosses the summit, June 1, 1868, will set its passengers down within sixteen miles of the Comstock ledge. By the same day, gangs of 10,000 laborers will be thrown out along the line of the Truckee and Humboldt, towards Salt Lake; and by the end of the present year, 300 miles of railroad will be laid down and put in running order.

GOVERNMENT EXPENSES.—Commissioner Welles, in his second annual report, says that the National expenses can and should be reduced from their present extent of about \$372,000,000, to \$290,000,000—thus effecting a saving of \$82,000,000. Of this saving he proposes to cut off \$32,000,000 from the taxes of the people, by remitting altogether the tax on cotton and all manufactured articles, except spirits and tobacco. The balance—\$50,000,000—he would have go towards decreasing the principal of the National debt.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTY, Secretary. Office, 308 Montgomery street, corner of Pine, San Francisco. 2v15

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 2v15-3m

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 6v16-aim

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-4f

MINERS, VISITORS to mining districts, R. R. EMPLOYEES, and TRAVELERS generally, should insure against all accidents in the Traveler's Life and Accident Insurance Company of Hartford before leaving the city.

WM. McDONALD & CO., Gen'l Agents, 121 Montgomery St., opp. Occidental Hotel. 7v16-q9p

Accidents.

The Traveler's Insurance Company, of Hartford, Ct., insures against death or disabling injury by accidents; \$3 to \$50 per week paid the assured in case of injury preventing the prosecution of his business; \$500 to \$10,000 paid to his family, or legal representative, in case of his death by accident. No medical examination required. WM. McDONALD & CO., Gen'l Agents, 121 Montgomery st., San Francisco, Opposite Occidental Hotel. 2v16-3m

CARD.

THE UNDERSIGNED, SINCE DISPOSING OF HIS Gallery on Montgomery street, has seldom been in the street without being asked where the best photographs were taken. Now, for the benefit of his friends and the public generally, he would recommend them to go to the COSMOPOLITAN ART AND PHOTOGRAPHIC GALLERY, No. 221 Kearny street, now owned and occupied by Messrs. HALSEY & SCRIPTURE. Both of these gentlemen are professional photographic artists—one of them having been in the business more than twenty years—and cannot be surpassed by any one in the State. Persons wishing photographs taken will do well to give them a call. The above named gallery is one of the finest and most convenient in San Francisco, it being situated on the second floor, and its proprietors are the most accommodating and gentlemanly men in the business. JAMES WISE, Portrait Painter. N. B.—Prices as low as at any other Gallery in the city.

Solar Printing for the Trade.

Also Stereoscopic Views of California Scenery, at wholesale and retail, at the Cosmopolitan Art and Photographic Gallery, No. 221 Kearny street. HALSEY & SCRIPTURE, Proprietors. 7v16-3m

KNICKERBOCKER

Life Insurance Company,

OF NEW YORK.

Assets, - - over \$3,000,000.

Number of Policies issued in 1867, 10,300.

Amount Insured, - - \$31,375,671 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks, at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1867.]

"The Company's history for the past fifteen years shows favorably, and its standing to-day ranks it among first class societies. It has carried out in good faith every contract made by it, never contesting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our national struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

Pacific Branch Office, 430 Montgomery Street, San Francisco.

GEO. T. SHIPLEY, M. D., Manager.

Agents wanted through city and State, and Pacific Coast. 6v16-3m9p

Oakland College School.

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address,

NEW MEXICO.

Denver News, Jan. 22d: A correspondent writing from the Cimarron mines, Jan. 6th, says: The snow at present covers the entire face of the country to the depth of one foot, which, of course, puts a stop to all prospecting and mining for the present. All that can be done is to prepare for the spring.

There is very little mining property offered for sale. Claim owners generally think they have a good enough thing to warrant them to suffer a New Mexican winter in order to be on the ground when the water comes. Lodes are being looked after considerably. I was shown some very fair specimens of both gold and silver quartz, by Mr. Pollock, Mr. Newman, Mr. Branagan and other prospectors. It is their opinion that good lodes will be discovered in this district.

UTAH.

Reese River Reveille, Feb. 6th: Samples of ore from the North Star ledge, in Little Cottonwood Cañon, in the Wasatch range of mountains, Utah Territory, have been deposited at the office of Boalt & Stetefeldt for assay, the average yield of which was \$110 silver per ton. The ore was a fine grained, compact galena, of which the ledge is said to produce great masses. A small smelting furnace was erected in the vicinity of the mine, and a sample of the lead produced by it was also brought in, which yielded by assay at the rate of \$411 of silver to the ton.

REMOVING STAINS.—All cloths subject to be stained, such as table linens, napkins, children's clothes, towels, etc., ought to be examined before being put into any wash mixture or soap suds, as these render the stain permanent. Many stains will yield to good washing in pure soft warm water. Alcohol will remove almost any discoloration. Almost any stain or iron mold, or mildew, may be removed by dipping in a moderately strong citric acid, then covered with salt and kept in the sun. This may require to be repeated many times, but with us has never failed.—Country Gentleman.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, prepayment of postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in the delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory:

NEWSPAPERS—MAILED AS FOLLOWS:

Bremen, by Bremen mail—2 cents each.

Hamburg, by Hamburg mail—2 cents each.

Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each.

Lunenbourg, by Bremen mail—3 cents each.

Lunenbourg, by Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1½ ounce.

Sweden, by Bremen or Hamburg—3 cents each, and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—3 cents each, and 3½ cents per 1½ ounce.

Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—4 cents each.

Italy, by Bremen or Hamburg—5 cents each.

Turkey, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Greece, by Bremen or Hamburg—3 cents each, and 5½ cents per 1½ ounce.

Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 1½ cents per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1½ ounce.

Austria, India and China, by Bremen and Hamburg mails via Trieste—8 cents each, and 2 cents per ½ ounce.

PERIODICALS, ETC.

Bremen, by Bremen mail—1 cent per ounce.

Hamburg, by Hamburg mail—1 cent per ounce.

Prussia, Austria and German States, by Bremen or Hamburg—1½ cent per ounce.

Lunenbourg, by Bremen mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Lunenbourg, by Hamburg mail—1½ cent per ounce, and 1½ cent per 1½ ounce.

Schleswig Holstein and Denmark, by Bremen or Hamburg—1½ cent per ounce and 1½ cent per 1½ ounce.

Sweden, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Norway, by Bremen or Hamburg—1½ cent per ounce, and 4 cents per 1½ ounce.

Holland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Russia, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Switzerland, by Bremen or Hamburg—1½ cent per ounce, and 1½ cent per 1½ ounce.

Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—6½ cents per ounce, and 2 cents per ½ ounce.

PSYCHOLOGY AND PHYSIOLOGY.—Psychology is the science of Mind; Physiology is the science of Life. All who recognize the former as a science, declare its aim to be the elucidation of the laws of Thought, the nature of the Soul, and its prerogatives. This science may seek—and I follow those who think it *ought* to seek—important means of investigation in the laws of Physiology; just as Physiology itself must seek important aids in Chemistry and Physics. But as an independent branch of inquiry, its results cannot be held amenable to physiological canons; their validity cannot be decided by agreement or disagreement with physiological laws. To cite an example: Psychology announces that the mind has different faculties, and that each of these faculties may have a temporary exaltation, or a temporary suspension. This fact seems established on ample evidence, and is valid in Psychology, although hitherto no corresponding fact in Physiology has been discovered—neither the anatomy of the brain, nor any knowledge of the brain's action, can be adduced as furnishing the evidence; and if Psychology were absolutely amenable to the conclusions of Physiology, we should here have to doubt one of the most indisputable of psychological facts. On the other hand, it is no less certain that the physiology of the Nervous system must be studied free from all control on the part of psychologists. If we do not prescribe conclusions for them, neither must they prescribe conclusions for us. To them we leave the laws of thought. To us they must leave the difficult task of ascertaining the relation between Sensation and the various parts of the Nervous system.—*G. H. Leves.*

THE GOLDEN ERA.

Founded in 1851, it is the oldest Weekly Paper in the State, permanently established, and more widely circulated at home and abroad than any other on the Pacific Coast. In California, the Atlantic States, and throughout the entire field of its great and rapidly increasing circulation, THE GOLDEN ERA is universally regarded as a Literary and Family Journal of unequalled excellence. Among its contributors are all the best writers on this side of the Continent.

THE GOLDEN ERA

Is the most universally popular of all the Weekly Journals. It presents forty-eight columns, containing the greatest possible variety of Valuable and Entertaining, Original and Selected matter. It is a welcome guest in Cottage and Cabin; the favorite at the fireside in city and country; the most useful, agreeable and altogether desirable publication for California readers and their kindred and friends in the Atlantic States, Europe and elsewhere. Every household in the mountains and valleys, the cities, towns and mining camps of California, and throughout the Pacific States and Territories, should receive and welcome THE GOLDEN ERA as a regular weekly visitor. Inspired with the genius of the age, it is progressive, and aims not so much at distinction as a newspaper, as at honorable success in its capacity of a great Moralizing and Improving Influence. Exercising a positive power for good, and wielding a permanent influence, many able and eminent writers choose its columns as a means of communicating with the public. No effort will be spared to make it a thoroughly California newspaper, and worthy of the support of all classes of our citizens.

N. A. BALL & CO., Prop'rs.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanicians it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—*Iron Age Union.*

And in accordance with law, and an order of the Board of Trustees, made on the second day of January, 1888, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Maurice Dore & Co., at their salesrooms, No. 327 Montgomery street, San Francisco, on Monday, the seventeenth day of February, 1888, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

HENRY R. REED, Secretary.
Office, 321 Washington street, San Francisco, Cal. feb15

Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of February, 1888, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 429 Pacific street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the sixth (6th) day of March, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth (30th) day of March, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. C. TAYLOR, Secretary.
Office, 429 Pacific street, San Francisco, Cal. feb15

Arizona Consolidated Mining Company, Eureka District, Arizona Territory.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-third day of December, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Z. B. Heywood	170, 219, 226, 245	38 1/4	\$193 75
W. B. Heywood	201, 221, 247, 260, 270	10	5 00
Simon Sumers	44	25	125 00
Hall Hamon	225	5	5 00
William H. Hodges	129, 166, 211	65	325 00
Mary O. Leonard	283	10	50 00
L. A. Austin	297	10	50 00

And in accordance with law, and an order of the Board of Trustees, made on the seventeenth day of December, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Saturday, the eighth day of February, 1888, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

P. CARROLL, Secretary.
Office, No. 87 Stevenson street, between First and Second, San Francisco. dec21

Postponement.—The above sale is hereby postponed until Thursday, the fifth day of March, 1888, at the same hour and place. By order of the Board of Trustees.

feb1 P. CARROLL, Secretary.

Ventana Gold and Silver Mining Company—Location of Works: Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighth day of January, 1888, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon each and every share of unassessable stock of the capital stock of said Company, payable forthwith in United States gold coin, to the Secretary, southwest corner Stewart and Folsom streets, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the tenth day of February, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-seventh day of February, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. W. SCOTT, Secretary.
Office, southwest corner of Stewart and Folsom streets, San Francisco. Jan1

Postponement.—The day for deemed stock delinquent on the above assessment is hereby postponed until Thursday, the twenty-seventh day of February, 1888, and the sale thereof until Tuesday, the twenty-fourth day of March, 1888. By order of the Board of Trustees.

feb15 A. W. SCOTT, Secretary.

Welch Quicksilver, Silver and Copper Mining Company, Mount Diablo Mining District, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-second day of January, 1888, an assessment of three dollars (\$3) per share was levied upon the capital stock of said Company, payable on the tenth day of March, 1888, to the Secretary, George Byles, at his office, Room No. 15 Stevenson House, southwest corner of Montgomery and California streets, San Francisco.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of March, 1888, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventh day of April, 1888, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEORGE BYLES, Secretary.
Office, Room No. 15 Stevenson House, S. W. corner Montgomery and California streets, San Francisco. Jan25

Olney & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than any other rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.**MOSHEIMER'S****Pioneer Mining School.**

Office, 348 Montgomery Street,
SAN FRANCISCO.

MOSHEIMER'S**NEW ROASTING FURNACE.**

Patent applied for.

This Furnace has proven the most successful of any ever built on this Coast. A great number are in use now, and many in course of construction. Their superiority over all other furnaces, is as follows:

- 1.—The cost of building is only \$300 for a one ton Furnace.
- 2.—They require less than half a cord of wood per ton of ore.
- 3.—The ore is roasted to a spongy condition; while in a common Reverberatory it cakes into globules.
- 4.—It is a saving of 50 per cent. of labor over any Furnace in use.

A full size working Furnace can be seen at my Metallurgical Works in this city, by applying at my office.

JOS. MOSHEIMER,

328 Montgomery street, San Francisco.

A Sulphuret Mine Wanted.

Any party having for sale a Mine, with Gold-Bearing Sulphurets, of not less than 15 per cent., and which pay at least \$50 per ton, can find a purchaser by addressing, in writing, particulars to

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merit.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pulp being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and so to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers make on the same principle excel all others. They bring the pulp so constantly in contact with the quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the

PACIFIC FOUNDRY,
San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Works Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

-BY-

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077
San Francisco.

DR. BEERS' PATENT

WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a cheap and simple apparatus by which the finest free gold can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this loss alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address

Dr. E. BEERS, San Francisco,
Per Wells, Fargo & Co's Express.

LEFFEL'S

American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALLED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc.

KNAPP & GRANT,
Agents for California.

NOTICE TO MERCHANTS

MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working; as goods require no landing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any fastening or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

By Joseph Moore, President.
JOSEPH MOORE.

HUNGERFORD'S

Improved Concentrators.

MR. HUNGERFORD, having been absent in the interior during the summer months, and engaged in the construction of several Quartz Mills, which have also been supplied with his CONCENTRATORS, has now returned to this city, and is prepared to answer all orders for his Concentrators, which are built either at the Miners' Foundry, in this city, or at Goss & Lombard's, in Sacramento.

Orders addressed to him at this city, by mail or express, will be promptly attended to.

MORAN HUNGERFORD.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$500
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE EXPOSING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa County, Rawhide Ranch, Tuolumne County, Excelsior Mine, Lake District, Nevada County, and can be seen in operation at the Fulton Foundry, First Street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County.

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.

JAMES BROWN, Esq., San Francisco—My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON,
Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the Improved German Barrel, for a longer term than twelve months. All persons desirous of procuring, without having recourse to legal process, for past infringements, or desirous of receiving Letters of License for the limited period named, are requested to address as below.

A diagram, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WINDBLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

JAMES BRODIE, Fulton Foundry, or Express Building, 402 Montgomery street, San Francisco.

ROYER, at 435 Brannan street, between Third and Fourth, refers to Eisen Bros, Pioneer Mills; Martin Steen, National Mills; Horace Davis, Golden Gate Mills; also, N. W. Spaulding, Saw Manufacturing.

PATINSON'S
HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them into, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use.

Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit.

THOMAS PATINSON

To Quartz Miners.

Two Quartz Mills for Sale at very Low Rates.

PARTIES WISHING TO PURCHASE WILL SAVE 50 percent by calling at HOWLAND'S SAMPLE MILLS, No. 24 California street, San Francisco.

Avery's Great National Pump and Well.

This Well is formed by driving metallic tubes into the ground until water is reached. The valves are then dropped down the pipe, then the pipe is raised six inches to allow free ingress of water. The Pump is now ready to work. For the first thirty minutes we draw up earth, etc., till a vacuum is formed, which makes the Well.

This Pump has proved itself to be the greatest invention of the age. It will raise water 500 feet. State, County and Town Rights for sale. Pumps furnished at moderate prices, by

Agent for California and Nevada,
S. P. ROBERTS,
318 Pine street, San Francisco.

BLAKE'S PATENT
QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

Constantly on hand and for sale by
CHAS. OTTO & CO.,
312 Bush street.

A FULL ASSORTMENT OF

Molders' Tools,
Constantly on hand and for sale at low prices, by
CHAS. OTTO & CO.,
Successors to Marwedel & Otto, 312 Bush st., a few doors above Montgomery, San Francisco.

NELSON & DOBLE,
AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk

Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools,
319 and 321 Pine Street,
Between Montgomery and Sansome, San Francisco.

LIFE IN BRAZIL.—The following extracts are from the new book on Brazil, by Agassiz: "The sun had set before we drove into the pretty town of Petropolis, the summer paradise of Rio Jeneirans whose circumstances enable them to leave the heat and dirt and vile smells of the city for the pure and enchanting views of the Sierra. In a central position stands the summer palace of the Emperor, a far gayer and more cheerful looking edifice than the palace at San Christoval. Here he passes six months of the year. Through the midst of the town runs the pretty river Piabana, a swallow stream, now rippling along in the bottom of its bed between high green banks; but we are told that a night of rain in the hot season is enough to swell its waters till they overflow and flood the road. I could not but think how easy it would be for any one who cares to see tropical scenery to come here, when the direct line of steamers from New York is established, and, instead of going to Newport and Nabant, to take a house in Petropolis for the summer. It commands all the most beautiful scenery about Rio, and the horseback rides are without end. During our summer the weather is delightful here, just admitting a semblance of wood-fire morning and evening, while the orange orchards are golden with fruit, and flowers are everywhere." * * "Just behind the house, on the slope of the hill, is the orangery. I am never tired of these golden orchards, and this was one of special beauty. The small, deep-colored tangerines, sometimes twenty or thirty in one cluster; the large, choice orange, 'Laranja selecta,' as it is called, often ten or twelve together in a single bunch, and bearing the branches to the ground with their weight; the paler 'Limon dulce,' or sweet lemon, rather insipid, but greatly esteemed here for its cool, refreshing properties—all these, with many others—for the variety of oranges is far greater than we of the temperate zone conceive it to be—make a mass of color in which gold, deep orange, and pale yellow are blended wonderfully with the background of green. Beyond the house enclosure, on the opposite side of the road, are the gardens, with aviary, and fish-ponds in the center. With these exceptions, all of the property which is not forest is devoted to coffee, covering all the hillsides for miles around. The seed is planted in nurseries especially prepared, where it undergoes its first year's growth. It is then transplanted to its permanent home, and begins to bear in about three years, the first crop being of course a very light one. From that time forward, under good care and with favorable soil, it will continue to bear and even to yield two crops or more annually, for thirty years in succession. At that time the shrubs and the soil are alike exhausted, and, according to the custom of the country, the fazendero cuts down a new forest and begins a new plantation, completely abandoning his old one, without a thought of redeeming or fertilizing the exhausted land."

GENTLEMEN FARMERS.—In Prussia there is a class of employees who are not found in any other country. These are educated young men belonging to families in a good position, often just leaving an agricultural college, who remain for a certain time on some large estate to initiate themselves in the practical direction of one of their own. This novitiate is an ancient custom still preserved in many trades. Thus, frequently, the son of a rich hotel-keeper will not hesitate to enter another hotel as butler or waiter (Kellner), to be initiated into all the details of the service over which he will one day have to preside. When any one visits the farms (Rittergut) he is astonished to see as superintendents the son of a banker, a baron, or a rich landowner. These young people drive a cart or guide the plow. At noon they return, groom their horses, and then go and dress themselves and dine at the owner's table, to whom they are not inferior, either in instruction, birth, or manners. After the meal, they resume their working dress, and return, without any false shame, to their rustic occupation. Thus we find in feudal Prussia a trait of manners suited to the democratic society of the United States, and which hereafter will become general.

CABLE RECEIPTS.—Since the reduction of the Atlantic Cable telegraph tariff on the 1st of December last, the average from that day to the 31st of that month, has been \$1,070 per day, as compared with an average of \$808 per day during the month of December, 1866; this is an increase of over \$260 per day, or at the rate of \$95,000 per annum, irrespective of the result that may be anticipated when commerce and speculation resume their usual activity. During the present month there has been a still greater expansion, the receipts now being upward of \$1,300 per day.

DIET vs. MEDICINE.—Dr. O. W. Holmes, no less noted as a physician than as a poet and wit, makes the following remarks upon this subject in "Border Lines":

"I cannot help believing that medical curative treatment will by and by resolve itself in great measure into modifications of the food, swallowed and breathed, and of the natural stimuli, and that less will be expected from specifics and noxious disturbing agents, either alien or assimilable. The noted mineral waters containing iron, sulphur, carbonic acid, supply nutritious or stimulating materials to the body as much as phosphato of lime and ammonical compounds do to the cereal plants. The effects of a milk and vegetable diet, of gluten bread in diabetes, of cod-liver oil in phthisis, even of such audacious innovations as the water-cure and the grape-cure, are only hints of what will be accomplished when we have learned to discover what organic elements are deficient or in excess in a case of chronic disease, and the best way of correcting the abnormal condition, just as an agriculturist ascertains the wants of his crops and modifies the composition of his soil. In acute febrile diseases we have long ago discovered that far above all drug-medication is the use of mild liquid diet in the period of excitement, and of stimulant and nutritious food in that of exhaustion. Hippocrates himself was as particular about his barley-pulsan as any Florence Nightingale of our time could be.

The present generation will make a vast stride forward, as I believe, in the direction of treatment by natural rather than violent agencies. What is it that makes the reputation of Sydenham, as the chief of English physicians? His prescriptions consisted principally of simples. An aperient or an opiate, a 'cardiac' or a tonic, may be commonly found in the midst of a somewhat fantastic miscellany of garden herbs. It was not by his pharmaceutical prescriptions that he gained his great name. It was by daring to order fresh air for small-pox patients, and riding on horseback for consumptives, in place of the smothering system, and the noxious and often loathsome rubbish of the established schools."

MAMMOTH CLOCK.—An immense clock, made by Mr. Hotchkiss, of New York, has recently been placed in the arsenal at Rock Island, Illinois. It will be connected by telegraph with the observatory at Chicago. It is thus described: The frame is eight feet long, three feet wide and seven feet high. The main time wheel is three feet in diameter. The pendulum is thirty-two feet long, and vibrates in three seconds, and the ball, weighing 400 pounds, is 4 feet in length by seven inches in diameter. The weight case is fifty-seven feet in height, and reaches down through three stories. The cord on which the weights are suspended is of wire, having strands of seven wires each. Of this wire cord, 250 feet are required for the striking cylinder, and 150 for the time. Each of these cylinders is eighteen inches in diameter.

VOLCANES UNDER THE MISSISSIPPI.—The examination of the mud cones on the bar at the mouth of the Mississippi, lately made by Professor Hilgard, of the University of Mississippi, under the authority of the Smithsonian Institution, was, in part, laid before the Academy of Sciences, at its last meeting. These cones were found in various conditions in various portions of the bar, from the outer edge to the inner, generally in clusters, and were the only earth which seemed to be firm. These cones, when fresh and new, were thought to be a species of volcano, throwing forth salt water, though located in the midst of fresh, and gas. The latter was caught and hurned with readiness. There were craters formed upon and within them as clearly as in the lava-vomiting volcanic mountains. When these craters ceased to be active, the cones disintegrated and fell away. The products of the cones are to be the subject of chemical and microscopical examinations.—*New Orleans Picayune.*

SUBTERRANEAN CHAMBER.—A discovery has lately been made in the commune of Vouvray, France, of a subterranean chamber, apparently of the time of the Roman conquest. The chamber was filled with dust and stones, from which have been taken many curious objects—an ax of polished steel, pieces of bone, and parts of red vases, whose surface is carefully hurnished and decorated with elaborate designs. Much of this collection is made up of common pottery; coins were found, and needles, bracelets, and other ornaments, besides a hundred pieces of bronze money of the age and stamp of different Emperors, but principally of Marcus Aurelius, Constantine, etc., nearly all in good preservation.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR

Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

For Circulars and further information, address

KEEP, BLAKE & CO.,
Globe Iron Works, Stockton, Cal.

HAYWARD & COLEMAN,

IMPORTERS AND REFINERS

—OF—

Illuminating, Lubricating,

—AND—

PAINT OILS!

CONSISTING OF

KEROSENE, LARD, SPERM, ELEPHANT, POLAR,
TANNERS', NEATSFOOT, BOILED AND RAW
LINSEED, CASTOR AND CHINA NUT.

—ALSO,—

SPIRITS OF TURPENTINE & ALCOHOL

NOTE.—We would specially call the attention of Mill owners and Engineers to our superior PARAFFINE OIL, which we manufacture from the California Petroleum. This Oil will not gum. Machinery thoroughly cleaned and lubricated with it will not heat, and after remaining at rest, can be started without cleaning off.

A sample can of our Paraffine Oil will be forwarded on application to us, as we desire a fair and impartial trial.

Lamps and Lamp Stock!

An elegant and complete assortment on hand. 19v13-3m
414 Front street, San Francisco.

ENLARGEMENT

OF THE

American Journal of Mining

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages,

Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in mining, mining and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year, for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, **WESTERN & COMPANY, Publishers, 37 Park Row, N. Y.**

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

**WE ARE NOW OFFERING

Theory and Practice Combined.

Our course of instruction combines *Theory and Practice* in a very superior manner. We have consulted the wants of the great masses, and arranged our course accordingly. Many advocate theory alone, some practice, but we regard each as imperfect in itself; since no amount of mere *theory* ever made a successful business man, nor can any one be expected to *practice* what he does not know. However, *properly* combined, they are the sum of perfection, and afford the most reliable and satisfactory course of instruction ever presented for public patronage.

By thoroughly mastering both branches, the student is fitted to enter at once upon the duties of a Book-keeper or Accountant with skill and confidence. We do not claim that they can manufacture brains where there are none to begin with, or give that ripe experience which is to be acquired only by long association with the hum and bustle of business circles. But we do assert that they will do more to assist the young man over the difficulties of life's beginning and set him upon a career of success, than any other means within his reach. Then let him remember that, amid the light of the nineteenth century, Practical Education is demanded, and it will determine whether he shall pass through life rich or poor, respected or despised.

Theoretical Department.

The Student is placed in this department upon entering the University; and upon the diligence which he here displays, and the thoroughness with which he masters the various branches here brought to his attention, will depend the success of his collegiate course. Some schools hurry their students through this department with the greatest rapidity, seeming to think that every day dispensed with is so much time gained. True, it may be a gain to them; but to the student it is more than lost time; it is the loss of a golden opportunity of acquiring useful knowledge that may never return.

In this department the student receives daily drill in book-keeping, extending from the simplest to the most complicated forms, business penmanship, commercial arithmetic, orthography, etc. The art of correspondence, political economy, and the application of mercantile law to the practical concerns of life, form the subject of interesting lectures and weekly practice. It is our endeavor to inculcate into the

student's mind the important fact that the foundation of a reliable business must be obtained in this department, and that when the foundation is wanting, no amount of mere superficial attainments will insure permanent success.

Practical Department.

This is entirely separate from the Theoretical Department, and is designed to render the knowledge there acquired *practical*, by means of *actual transactions*. We have prepared a comprehensive "Business Manual," as a guide to the student in this department, in order to introduce the regular routine of the counting-house. By this means students are enabled to acquire more extended and varied information in much less time than by the method adopted by most schools, of allowing them to grope along without information, or any incentive to seek it. They now become Book-keepers, dealing with *bona fide* transactions, handling money (College Currency), and having the same duties and responsibilities resting upon them as if actually employed in the counting-room. Here the great superiority of our course of instruction, and its special adaptation to the wants of all desiring to become practical accountants, will become apparent to all stopping to investigate the matter. The student is not confined to any one form or single routine of business; but, relying on the comprehensive principles acquired in the Theoretical Department, he becomes alternately the Retail and Wholesale Merchant, Jobbing and Importing Merchant, Manufacturer, Insurance Agent, Railroad Superintendent, Mining Secretary, Commission and Forwarding Merchant, and lastly, Banker. In connection with these various duties, he is obliged to write up and become familiar with Notes, Drafts, Receipts, Orders, Bills of Exchange, Checks, Bills, Certificates of Deposit, Accounts Current, Account Sales, Bills of Lading, Bonds, Mortgages, Deeds, Leases, Contracts, Profits, General Averages, Articles of Copartnership, etc.

Young Men of the Pacific Coast

Should examine the merits of our practical and useful course of study. All who would be successful in business should avail themselves of this opportunity of acquiring a thorough Commercial education. The College Circular, giving full particulars concerning the Institution, besides other valuable and interesting matter, will be sent free by addressing

E. P. HEALD, President,
San Francisco.

Foundry and Machine Business.

The foundry and machine business of San Francisco has become one of great importance. It is chiefly confined to a section of the city bounded by Market, First, Folsom and Beale streets, and comprises nine blocks. Over that entire district the clatter of machinery, the rattling of hammers, the puffing of engines, and the fires of furnaces, give notice to all of busy work in progress. There are but few if any cities of equal population which can boast of such varied and extensive mechanical industries as are found in San Francisco. Proba-bly five-eighths of all the mining machinery

veniences, that, for general advantage of work in its details, as well as neatness and symmetry of outward design, will compare favorably with the best arranged establish-ments of this kind in the country, excepting, perhaps, only some of the larger works on the Atlantic seaboard, where heavy ma-rine engines are built.

The illustration herewith presented shows the front elevation which the main building of the works will present on Beale street, a part of which is already erected, and the whole of which will probably be completed during the coming season, unless the rapid advance in the value of real estate shall continue so long as to compel a general

of 35,000 gallons per minute to a height of 27 feet. We were also shown a small portable engine, designed more particularly for running these pumps, which can be built for a small price, and which is so simple in construction that it can be run safely by almost any person that can manage an ordinary water-wheel. They have also several other descriptions of labor-saving machines, for placer and hydraulic mining, the man-ufacture of which they intend to make specialties, and some or all of which we shall probably illustrate in future issues of the Press.

A WORD TO MINERS.—The indications are that there will be a rush from all parts of the country to the new mines in Dacotah, in the spring, and we learn that parties are even now fitting out, intending to breast the difficulties of the trip, in order to be on hand when the spring opens. It seems that under some circumstances, men who ordinarily have good judg-ment and sound sense lose those faculties, and do acts under the excitement of the moment, which, in their cooler moments, they would reject as absurd. It would seem that California miners, above all other classes of per-sons, should weigh well their chances before allowing them-selves to be led off by excite-ments; certainly their experi-ence in such affairs is not the most encouraging.

The news thus far from those mines, is not of such a char-acter as to induce any person not laboring under a stubborn fit of mining fever to give up any lucrative business or labor, for the purpose of testing the truth of the bright side of the reports. Yet persons are always to be found ready to follow any and every will-o'-the-wisp that prom-ises even the smallest prospect

of reward, and in nine cases out of ten, they will find that they have not only been im-poverished in pocket, but also in health.

PRACTICAL MINING ENGINEER.—The card of J. S. Phillips, M. E., will be found in our advertising columns to-day. Mr. P. offers his services for the inspection and valuation of all kinds of mineral properties; also for superintending the construction or operation of smelting works, mining machinery, etc. Mr. P. produces credentials of high authority for his skill and experi-ence as a mining engineer, having had large experiences as a founder and mining and mechanical engineer in Cornwall and Devon, and other parts of England. He has recently been visiting, as an expert, the mines of eastern and northwestern Nevada in the interest of Eastern capitalists. His last engagement was to re-model and superin-tend the argentiferous smelting works at Torrey City, Nevada, where, we understand, he has succeeded in effectually reducing the very refractory argentiferous antimonial lead ores, the smelting of which had previ-ously been found impracticable. See his card.

Contributed for Our Cabinet.

Under this heading we shall continue to mention and de-scribe, according to merit, such specimens of ores, min-erals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

Mr. J. S. Phillips has placed upon our table a very fine sample of ore from the Torrey Mines, Humboldt County, Nevada, upon which furnaces have recently been erected. The ore consists of carbonate of lead and antimony, carrying about \$25 per ton of silver. We have numbered this specimen 191 in our cabinet collection. The same gentleman has also contributed a very fine furnace specimen, No. 192, the base of which consists chiefly of antimony, showing the peculiar form of crystallization due to that mineral. The surface is mostly covered with beautiful cubical crystals, com-posed, we presume, chiefly of lead, and containing about \$50 per ton of silver. There are other crystals of irregular form, containing, no doubt, a larger amount of antimony, to the presence of which the ir-regular form of crystallization is probab-ly due. This specimen was the result of a very slow cooling; that process having oc-cupied about one week of time.

We have received a package of ores from Esmeralda, forwarded by Mr. T. W. Ahra-ham, of Pino Groves, in that district. No. 1, being a specimen of the surface ore, and No. 2, sulphuret ore from Wheeler Co's mine. No. 3 is described as being below the average of surface ore, and No. 4 as above the average; No. 5, a very fine spec-imen of gold ore, the gold being seen in distinct particles interspersed throughout a very friable envelope of oxide of iron; No. 6 is sulphuret ore—the four last are from the Wilson mine. Mr. A. observes in a letter to Prof. Rowlandson, which ac-companied the specimen, that he considers those marked "above average," and "spec-imen," ought to pay from \$50 to \$75; in fact we should think that a very small part of a ton of the variety marked "specimen," ought to yield that amount. Of the sur-face rock, a portion will be retained by Prof. Rowlandson, as also the sulphurets, for more careful examination, the result of which will be communicated to Mr. A., by mail. We wish to impress upon our friend the great desirability that, when wishing to obtain an opinion respecting the value of a lead, that they should follow the example of Mr. Abraham, in selecting average sam-ples, and particularly in selecting excep-tional, and to what extent, when rich ores are for-warded as specimens.

PROPOSED NEW BUILDING OF THE VULCAN IRON WORKS.

employed on this coast is made in this city. The amount of foundry and machine work required to keep our hundreds, if not thou-sands of mills in operation and repair, and to provide the machinery for new mills that are constantly going up,—to say nothing of flour, cotton, woolen, sugar and other mills and manufacturing operations that are being called for,—demand the constant employ-ment of a good sized army of mechanics. So rapid, also, is the increase of the de-mand for machinery, that our foundries are almost yearly required to enlarge their works and facilities to keep pace with our growing industries. We are called upon every year to notice improvements of this character.

The purpose of the present article is to chronicle an important step in this direction by the proprietors of the Vulcan Iron Works. This concern, in view of the cer-tainty of increase of business, has deter-mined to enter upon a plan of improvements which can be made gradually progressive, and which, when completed, will form a systematic arrangement of shops and con-

movement of our foundrymen to a greater distance from the commercial center of the metropolis.

The Vulcan Iron Works are now occupy-ing 75 feet on First street, through to Fre-mont, and 137½ feet on both sides of Fre-mont street, then through to Beale, where they have a frontage of 182½ feet, which they propose shall eventually constitute the main front, and which will then present the elevation given in our engraving. At present these works share in the general stagnation of business due to the winter months, which have this year been of ex-traordinary severity. With the recent im-provements in the roads, etc., however, they are already picking up, and constantly tak-ing in more hands.

During a recent look through these works, we were shown a new centrifugal pump, which they are building and adapt-ing especially to miners' use, and to which they are turning particular attention, with the view of cheapening the same and bring-ing it within the reach of men of limited means. These pumps are equally adaptable to the heaviest and the lightest work, while one of small dimensions can be easily turned by hand. A pair of them have just been constructed for the Dry Dock Com-pany at South San Francisco, which is capable of raising the enormous quantity

The Freiberg, or Barrel Process, for the Reduction of Gold and Silver Ores.

BY PROF. ROWLANDSON, F. G. S. L.

NUMBER THIRTEEN.

Very recently in the course of this series it was noticed, quoting from the report of the Gould & Curry Company, that from the slimes the greater part of the silver was saved by the barrel mode, but not so with the gold. The following quotation from a recent arrival from Australia, on the contrary, serves to show that the barrel method is an excellent one for saving light or float gold from tailings:

NEW TREATMENT OF TAILINGS.—Some experiments in the treatment of tailings have lately been made at the Black Hill Co's works, by Mr. Newman, the manager, the results of which are so far eminently satisfactory. Allusions have been made on former occasions to the adoption of small cradles, one under each outlet from the ripple-boxes, in which it has been found that a very large proportion of the metallic sulphides can be collected before the sand passes over the blankets. This plan is found to double the former average yield got from the blanket alone, and to secure most of the gold existing in the pyrites, which is thus easily separated from the larger mass of quartz tailings. But Mr. Newman's researches led to a belief that there was still a quantity of free gold in an impalpable state, which got away with the sand and water, and it was resolved to ascertain what proportion this bore to the entire yield. A series of small experiments was first undertaken in a Wedgwood mortar, in which tailings were amalgamated for the space of a quarter of an hour, the mixture being merely stirred round, but not ground, so as to assimilate the operation as nearly as possible to that of an amalgamating harrel. The first three results showed a return of 4, 3, and 4 dwts. per ton respectively, and a trial on a larger scale was made in a revolving harrel. The result of treating 7½ cwt. of refuse tailings was 3 dwts, 6 grs. of gold, or at the rate of 8 dwts, 16 grs. per ton, being considerably more than the gross yield hitherto averaged. The time allowed in the barrel experiment was eight hours, as usually practiced with tailings from the blankets. There are still some unsettled questions as to the probable loss of quicksilver, and the feasibility of reducing the cost of the washing off after amalgamation, a process at present tedious, and forming a large item of expense. But if these difficulties should be overcome, and there are good reasons for believing that they may, there then only remains that a sufficient number of barrels be erected to treat the whole of the tailings at present running to waste from the mill. The expenditure for this purpose must of course be somewhat large, as from 50 to 60 barrels will be required, as an encouragement towards which the experiments and calculations made, go to prove that there is at least one-third more gold than can be saved by the present process, and as 3 dwts. per ton is the lowest paying average, it follows that 1 dwt. per ton remains to be collected by the new process, which even at a cost of 3s. per ton will yield a fair profit. It is probable, however, that the cost of treatment may be reduced below this, and if so the company has reason to congratulate itself on future prospects.—*Ballarat Star*.

It is highly probable that the discrepancies just noticed, are more apparent than real. In the first place, the slimes alluded to being in a very finely divided state, were in a favorable condition when exposed for any lengthened period to the joint action of moisture and the atmosphere, for causing the decomposition of the sulphurets present, and if salt was also present in the water, both basic sulphates and chlorides of iron—both of which are of an insoluble character—would thus be formed. Such basic salts, possessing an ochreous appearance, would alone be calculated to form a covering over the light, flakey gold, and so prevent its amalgamating with quicksilver. This tendency to envelop the precious metal would probably be still more

promoted in cases where the dichloride of mercury, either alone or in combination with chloride of silver, were by any chance simultaneously formed.

HINT FOR HALE & NORCROSS STOCKHOLDERS.

Reports of an exciting character were rife last week of a warfare being carried on between two parties struggling to obtain, at the general meeting of the stockholders of this company, which will take place in a few days, the control of the affairs of this mine. In place of an unfriendly struggle of the character alluded to, would it not be more beneficial to the *bona fide* stockholders,—by which term is meant to imply those who for some time have, and purpose to hold in future, an interest in the undertaking,—for some cool-headed party to advocate, at the forthcoming meeting, the propriety of setting on foot an inquiry into the cause why, in the course of reduction, so much silver is wasted—amounting to \$92.30 for every \$100 obtained,—or nearly one-half the silver contained in the ore, and forming a sum total of more than \$400,000 of silver bullion on 15,639 tons of ore; which sum, divided among 800 feet, would be equivalent to a loss of dividend to the extent of \$500 per foot for the period during which the above quantity of ore was being worked.

ONLY A RAILWAY "TRAIN."—The Washington correspondent of the New York *Sun* says that Mr. Train's business in England has not the remotest connection with Fenianism or any other political affairs. When he resided in London some eight years ago, he obtained from the Government a patent for street railways, or tramways as they are called there, with cars drawn by horses, and actually constructed one such railway in London and another in Birkenhead. The former enterprise was very successful, and was about to become very remunerative when it was stopped by the courts, and the rails were removed as a nuisance. The undertaking at Birkenhead has never been interfered with, but for some reason has not been very profitable. Of late, however, public attention has very generally been called to the subject by reports of the universal use of such railways in the United States, and a disposition been shown to commence the building of them in various quarters. Mr. Train has accordingly gone to England to protect his interests under his patent, and to see that no new street railroads are constructed without the due recognition of his rights. His arrest has grown out of the jealousy and intrigues of those who were about to violate his patent, and who naturally preferred not to pay him anything for its use. These persons have set on foot the story that he was a Fenian, and have had influence enough with the Government to secure his arrest.

SINGULAR SPRINGS.—The Santa Cruz *Times* says: On the ranch of Mr. A. Manchester, about nine miles from Santa Cruz, at the foot of a high hill, there are three springs, each with a peculiarity of its own. They are situated quite near together (but a few yards separating them), and would be quite an interesting study for the geologist. The first is a sulphur spring, highly impregnated, the water being covered with a sort of scum, as pure and white as snow; and in the summer, when the water is low, a still stronger sulphur taste is apparent. The debris or settlements at the bottom of this spring has a beautiful appearance, all the colors of the rainbow being presented. The waters of the second spring are clear and beautiful, but the sediment at the bottom is as black as coal. This water has a most peculiar and far different taste and smell from the former, neither being used as drinking water. The third is a clear running spring, the sediment at the bottom being of a yellowish-red color, completely covering the ground over which the water flows and having much the appearance of terra sienna. The water of this spring is excellent for drinking. Truly, these are a strange cluster.

DIGGING MACHINE.—A powerful digging machine is now in operation in New Jersey, which is said to be achieving wonders. It is run by steam, and is located in the marl beds of Monmouth county. It is at work excavating a canal fifteen or twenty feet deep and seventy-five or a hundred feet wide, taking up a ton of marl a minute and depositing it in cars running on rails laid beside the canal, to be conveyed miles away to the doors of the farmers in that part of New Jersey.

Beach Mining on the Northern Coast.

EDITORS PRESS:—I have been examining with some degree of care the auriferous sands of the coast of Northern California. The great submarine placer, extending from Point Reyes to Puget Sound, is one of the many wonders of the Pacific coast. The axis of this gold belt lies beneath the deep ocean, and only its eastern margin, viz., the sea beach, is visible to us. At some future geological period, the entire placer may be upheaved, and offer its treasures to the generation of some millions of ages hence. It is more likely, however, that impatient miners may not wait the slow action of cosmical forces, but will send down among the whales some Yankee craft to sweep old Neptune's floor for him, and bring away the dust; not caring, when the gold is deposited in the California Bank, whether the sand banks are "bulled" or "beared."

GOLD BLUFFS.

Everybody has heard of Gold Bluff, and the insane excitement growing out of it in '51; how the rushing, pell-mell multitude built up a city at Port Trinidad—the nearest landing—and how reaction followed on the very heels of the crazy furore, and how the deep, muttering denunciations of the unsuccessful slowly and sadly died away, and Gold Bluff was forgotten. The city of Trinidad, with its 3,000 population, built up in three months, was left with only three white male inhabitants. The brick stores, comfortable hotels, and gay saloons were tenantless. The fleet of twelve steamers and twice as many sail vessels, were replaced by a few digger canoes. The ruins of the ancient city are still to be seen lying loose around—dust returning unto dust. A new town is however now growing up, and commerce is again visiting the pleasant bay of Port Trinidad.

Among the returning crowd of gold hunters, a few faces were missed. A few hardy sons of the shovel, either would not or could not get back, and so they pitched their tents at Upper and Lower Gold Bluffs, washing sand one day in a week, and fighting Indians the other six. Here they stuck, and are still sticking, and have grown rich, and well they deserve it. Gold Bluff was no humbug after all, and its sands will probably never be exhausted of their richness.

The first large body of sand I examined, extends from the mouth of El river to the entrance of Humboldt Bay, a distance of some twelve miles. Every shovelful of the millions of tons shows the yellow scales. North of the entrance, I made no examination short of the mouth of Mad river. From this point to the mouth of Little river, ten miles, the beach is auriferous, and is bordered with sand ridges and intermediate depressions for a breadth of the fourth of a mile. Recently, these sand ridges and the adjacent beach have been all located, the entire distance from Mad river to Little river. A good deal of excitement prevails in the vicinity, in consequence of rich deposits being discovered a few feet beneath the surface, and are supposed to underlie the whole district. Several streams of water coming in from the hills have been eagerly snatched up. Water is king, and whoever secures it holds the key to the treasure. The water-rights are mostly secured by substantial business men of Arcata, among them Captain Fauntheroy, well known on our northern coast, who are preparing to organize a company for extensive work. North of the mouth of Little river there is an extensive beach, with large deposits of good sand. This, with the adjacent streams of water, has been recently located by parties who are preparing for work.

TRINIDAD BAY.

North of Little river, is the above bay. It was visited and named by Bodega in 1775, and twenty-five years thereafter by Vancouver. The pile of stones raised as a monument on Trinidad Head by the first explorer, is still to be seen; but the wooden cross, with inscription surmounting the mound, is no longer visible. The harbor is completely sheltered from the prevailing northwest winds. Steamers from San Francisco visit here every two weeks, and a few lumberers are employed in taking away lumber cut from the interminable forests of redwood and spruce. This point, as before

named, was the early embarcadero of the Gold Bluffers, and the auriferous beaches in front and north of the harbor, were the scenes of some of the early and crude efforts at beach mining. The business of washing is still conducted here, and preparations are on foot for extending and rendering the work permanent. The locality is said not to be so rich, but facilities for lumber, water and approach, are superior to any other point on the coast. Twenty-four miles farther north are Upper and Lower Gold Bluffs, and a few miles farther, Oshigan Bluffs—all actively worked. At Crescent City are also extensive workings, as well as at Whale's Head, Pistol River, Gold Beach, and so on up along the coast of Oregon.

WHERE THE GOLD COMES FROM.

The gold seems to come from the disintegration of the shore. The coast is a slate formation overlaid by deposits of washed gravel. The sea has encroached extensively on the land and exposed fine sections at several points, where the relative position of the materials can be seen. The upper deposit varies in thickness from a few inches to two hundred feet. At Gold Bluff the bottom of this deposit is not seen, the entire perpendicular shore consisting of clay, sand, gravel and boulders. Huge trees embedded in blue clay are exposed in the space betwixt tides. They are seemingly of the existing species, some of them are sound wood, others are changed to lignite. This overlying gravel extends back a distance of ten or twelve miles, to the base of the "Bald Hills," as the coast range is here named, filling up deep and extensive valleys in the original surface. No fossils, save the trees above named, occur to aid in estimating the geological period at which this great filling-up process took place. These deep deposits form bluffs as the waves wear into them.

The richest localities on the coast are in front of these gravel bluffs, upon which the sea is gradually encroaching. With every storm they are more or less undermined and huge masses of clay, sand and gravel drop from the perpendicular face and are carried into the submerged placers to be washed and tumbled about, and the gold sent back with the ground swells to glitter on the sunny beach, and likely to be withdrawn into the Neptunic treasury by the next tide. The miner in the meantime is not idle, but follows the tides back and forth, gathering up and wheeling off to places of safety the precious sands to be washed at any convenient interval.

HOW THEY OBTAIN IT.

After years of experience with the usual heart-sickening disappointments and hopes deferred, a pretty effectual method is now used for catching the gold. Washing over extensive amalgamated copper plates interspersed with quicksilver rifles and the use of sodium-amalgam has at last given new life to beach mining enterprises. Much remains yet for ingenuity and skill to perfect, and doubtless that kind of mining will be soon extensively developed.

ITS ADVANTAGES AND DRAWBACKS.

The favorable side is the small amount of capital required and the inexhaustible supply of material. The same spot may be washed and renewed month after month for years, and yet no apparent diminution of value occurs. The unfavorable side is the difficult access to most of the beaches. The small number of harbors along our northern coast, leaving wide spaces to be reached only by land, over a rough and broken country by roads not likely to be soon improved. Humboldt, Trinidad and Crescent City, and points near to them, present many features favorable to permanent and very pleasant as well as profitable mining. Platinum and iridium are mingled with the sand. I believe, however, but little value is attached to them, and no attention is paid to saving them, although considerable quantities might be obtained. The gold is of high standard,—from \$18 to \$19 per ounce. At some points an ancient beach is found to extend back some two or three miles from the present shore. It is now covered with huge redwood trees, sending their roots into deposits of black sand as rich in gold as that on the present water line. Truly yours, V.
San Francisco, Feb. 10, 1868.

ANOTHER SCIENTIFIC MAN GONE.—Prof. William Mitchell Gillespie, who occupied the Chair of Civil Engineering in Union College, died on New Year's day, aged 51. He published treatises upon Surveying and Road-making, which are looked upon as standard works. He also translated from the French, Comte's "Philosophy of Mathematics." He has held his Professorship for more than thirty years.

Mechanical.

MANUFACTURE OF STEEL AND MALLEABLE

IRON BY THE USE OF NITRATES.—Mr. J. Hargreaves recently read a paper before the Liverpool Polytechnic Society upon this subject. He said that although inventors knew the value of the nitrates and chlorates, they have not been able to regulate their action, in consequence of their tendency to rise too rapidly to the surface of the melted iron. To get over this difficulty he makes the converting materials into blocks or balls, and fixes them on the ends of iron rods. These balls being made hard by drying, are ready for use. When the iron is fused in the puddling-furnace, and the boil has commenced, one of these balls is pushed to the bottom of the metal in the furnace—the products of its decomposition rise through the metal, causing rapid agitation, which is much more effectual than that produced by the puddler with his tools. After the ebullition has ceased, the rod is withdrawn and another put in its place. The time occupied in puddling is thus very much shortened, the labor very much reduced, fuel saved, and a better yield of metal obtained, in consequence of the soda forming a base which readily combines with the silicic and phosphoric acids eliminated from the iron. The malleable iron produced from cast iron which has been treated with nitrates is of a very superior quality, having great range of temper. The same metal, which by gradual cooling is fit for purposes requiring great toughness and powers of endurance of bending and torsion, may by rapid cooling be made sufficiently hard for wood-cutting tools; and its freedom from impurities is shown by the remarkably thin scale formed when the iron is worked by the smith, and the consequently small amount of loss in working. Refined iron, for the manufacture of malleable iron in the puddling furnace, may be made by the use of about three per cent. of nitrate of soda, and six per cent. of peroxide of iron; steel by eight to ten per cent. of nitrate, and an equal weight of binoxide of manganese; malleable iron by eight per cent. of nitrate, and twenty per cent. of peroxide of iron; in each case iron with five per cent. of carbon being used.

IMPROVEMENT IN DRILLING APPARATUS.—

A machinist of Leeds, Eng., has patented an arrangement, the object of which is to avoid the accumulation of the borings, in drilling metals, and secure the constant lubrication of the drill. The work to be drilled is mounted vertically above a tank containing lubricating material, and bored upwards from the lower end by fixed drills mounted in the tank. The tank is charged with water or other lubricant, keeping the level of the same above the cutting edge of the drills, and the work will, therefore, be lowered down into the lubricant as the operation proceeds. When boring gun-barrels or other light work, three or more slides or carriers for receiving the work may be conveniently arranged around the central standard. The carriers, being capable of sliding in the vertical guides, will descend as the boring proceeds, or a self-acting motion may be applied to regulate the descent of the carriers when the machine is adapted for heavy work.

HARDENING FILES.—

Some forms of files are apt to become curved in the act of hardening; hence to produce a straight file it is purposely bowed, while soft, in the reverse direction. This is the case with the half-round file. Most of the other forms are gradually heated to a dull red, and then straightened by striking them with a leaden hammer upon an anvil of the same material. In "quenching" the file, or plunging them into cold water, it is difficult to prevent some degree of set or curvature. Each file is therefore watched, and after being plunged once into the water, if there is any bending, it can be remedied before it is cold, by placing it between two iron bars, and applying pressure in an opposite direction,—lading water upon it with the hand.

DOUBLE-FLANGE CAR WHEELS.—

It is proposed to prevent accidents like the recent one at Angola, by having a flange on each side of the wheel, instead of, as now, only on the inside. In this case, one sound wheel on each axle is enough to insure the safety of the train.

REACTION AND RECIPROCATING ENGINES.

A writer in the *American Artisan* for Jan. 15th,—in answer to the correspondent of that journal a portion of whose communication we quoted in our last issue,—upon the velocity of steam pistons working with greatest economy, says: Steam at the pressure of the atmosphere, has no useful power. At two atmospheres it has a useful force equal to overcoming its inertia with a velocity of 600 feet per second. At twenty atmospheres it has a force and velocity of 1,600 feet a second. The resistance of the atmosphere relative to the force of steam is, in round numbers, in the first case, as 1 to 1; in the second, as 1 to 2; and, in the third, as 1 to 20. The last is so inconsiderable that, could the exit orifices of an Avery or reaction engine, using steam at 20 atmospheres, be driven with a velocity of 1,600 feet a second, or a reaction wheel on the principle of the turbine, with a little more than half this velocity, they would be economical motors; and notwithstanding the general, though mistaken, notion that the reaction engine necessarily loses one-half the force of the steam, it is, nevertheless, a fact that a fifteen-horse Avery engine, using steam at ten atmospheres, was run more than twenty years in Attorney street, in the city of New York, with more economy in fuel than has since been shown by the best reciprocating engine which the Novelty Works could build for the same proprietors.

Steam, following a reciprocating piston, takes from its initial pressure a force just equal to its own momentum, which is again returned, and acts on the piston during the last half stroke. Hence, whatever may be the velocity of piston, less that due to the steam at its initial pressure—other things being equal—there can be no loss of power from such velocity.

THE HUGON GAS ENGINE.—In this engine, as now perfected, the gas, as soon as turned on, enters the cylinder, mixed in its passage with about nine times its bulk of common air. The gas having been turned on, all that is necessary to start the engine is to light two ordinary jets of gas, which in their turn light two others. These last inflame the explosive mixture of gas and air conveyed to the cylinder, and being extinguished by the explosion, are relit by the two jets fixed outside the cylinder. At the moment of explosion, a very fine spray of water falls on the piston, and (the heat being then 1,200 degrees) becomes steam, thus reducing the heat and equalizing the pressure throughout the stroke. It is impossible to enumerate the advantages this engine offers. It is as easily set to work as a jet of gas is lit, and is as instantly stopped. Its simplicity, economy, cleanliness, and, above all, its safety, entitle it to rank foremost in its class. Its steadiness in working is remarkable; with one hand on the piston-rod, we could detect no shock from explosion, nor any unsteadiness whatever. This engine needs nothing but the turning on of the gas to set it in full work, and requires no overlooking. No fuel needs be kept, and no smoke issues from it. It attracted considerable attention at the Paris Exhibition, where several were at work.

The above is condensed from the *Mechanics Magazine*. We made some mention of this engine in our issue of August 24th, 1867.

LOCOMOTIVES FOR STEEP GRADIENTS.—

Various plans have been devised to enable an engine to mount steep grades. Mr. Fell, on the Mount Cenis railway, has a central rail which is gripped by four horizontal wheels; another has a central rail which is cogged, and gears into a central driving wheel; another climbing engine, invented by a Mr. Page, has broad driving wheels which bite into a tramway of roughened stone laid alongside the rail.

MALLEABLE CASTINGS.—It is noted as a fact in casting steel to patterns, that a Sheffield (Eng.) firm have cast a hydraulic cylinder eight inches in diameter and two and a half thick, perfectly sound and malleable. The William Butcher Steel Works, Philadelphia, Pa., have recently cast a hydraulic cylinder twelve inches in diameter and but one and three-fourth inches thick, perfectly sound and malleable, which is a much more difficult casting to make, on account of the thinness of the metal.

Scientific Miscellany.

"ROTTEN" CAST IRON.—This expression is used to describe cast iron in a peculiar state, which is due to exposure to sea water, or to the atmosphere under certain conditions. The change which it undergoes is unlike ordinary oxidation, or rusting, which shows itself upon the surface and in the reduced size of the article,—and which lessens the strength only in proportion to that reduction. It is a diminution of cohesion, without any apparent diminution of material, and is not accompanied by any external change in appearance. Mr. Crace Calvert, F.R.S., of Manchester, Eng., placed cast iron cubes in bottles containing very dilute acids. After three months, although there was no change apparent to the eye, a knife-blade would penetrate the cubes to a depth of about one-tenth of an inch. The acid was then replaced by a fresh supply, and this repeated monthly for two years. The result was an entire change in the nature of the metal. Instead of iron, it seemed to be a soft carbon compound of comparatively light weight, of the same size and shape of the original iron cubes. Acetic acid acted most energetically; next, hydrochloric, and next sulphuric acids. These acids are found in sea water under various circumstances; and as there are many structures which are liable to be thus weakened, *Engineering* says the condition of the work so situated should never be lost sight of, but periodically inspected in reference to this point.

THE METEORS OF NOVEMBER LAST.—At the National Observatory, Prof. Newcomb, of the navy, obtained the parallaxes of several of the November meteors or "meteoroids," by means of telegraphic connections between various places; and with such data made approximate calculations of their heights, distances and velocities. The brighter ones were found to be at an average height of seventy-five miles, and were extinguished at an average height of fifty-five miles; the mean length of their path hardly exceeding twenty-two miles.

Prof. N. considered that in the thickest part of the shower, there was an average of one in every 900,000 cubic miles of space. And supposing the shower to be three hours in duration, the thickness of the stream from north to south would be 60,000 miles. The meteoroids are distributed along it probably at the rate of 40,000 to the linear mile, a million passing every second.

The data for establishing their magnitude are imperfect. Several were so brilliant that their reflection could be seen from the face of the chronometer, even in the bright moonlight. From this it would, at first sight, appear that these bodies must be very large. But quite another element must be considered. It appears from experiments cited in the *Philosophical Transactions*, that a body moving through the air with the velocity of the meteoroid, say 280,000 feet per second, "will be exposed to a temperature of more than 3,000,000 degrees of Fahrenheit, a temperature of which we see the effect in the intense brilliancy and almost instant vaporization of the body exposed to it."

In connection with this fact, and from other considerations assigned, Prof. Newcomb believes that "Comet 1, of 1863," commonly called Temple's Comet, or Tuttle's, as it was also discovered by Paymaster Tuttle, of the navy, which the entire November stream of meteoroids is known to follow in its orbit, is itself simply an agglomeration of meteoroids, just dense enough to be visible in the solar rays; and he thinks the same to be true of other telescopic comets.

EFFECT OF PRESSURE ON FREEZING.—M. Mousson has found that a powerful pressure not only retards the freezing of water, but prevents its complete solidification. In this case the pressure opposes the tendency of the water to expand on freezing, and thus virtually lowers the point of solidification.

NEW ANÆSTHETIC.—Dr. Richardson discovered, in August last, the anæsthetic properties of the bichloride of methylene. This differs from chloroform in containing one atom less of chlorine and one atom more of hydrogen; being represented by CH_2Cl_2 , while chloroform is CHCl_3 . Dr. R. says: "In its action the bichloride of methylene is more gentle, but as effective as chloroform; it produces less struggling and less vascular excitement. Its narcotic effects are equally prolonged. It acts very uniformly on the nervous centers. It sometimes produces vomiting. When it is carried so far as to kill, it destroys by equally paralyzing the heart and the respiration. It interferes less than other anæsthetics with the muscular irritability." Dr. R. expects that it will prove less fatal than chloroform, which causes death, he estimates, once in fifteen hundred cases.

The same gentleman has investigated the action of the hydride of methyl, which is identical with fire-damp and marsh gas. He found that pigeons could live for half an hour in an atmosphere containing 35 per cent. of the gas. Death finally came like a sleep—so gently that it was difficult to fix the moment of it. He came to the conclusion that the victims of a mine explosion die an easy but prolonged death. Exertions for the rescue of such persons should therefore not be abandoned, even for days after the accident.

A FASHIONABLE SCIENTIFIC TOY.—

A French jeweler has contrived a galvanoelectric novelty, which is delighting the dandies of Paris. He makes scarf-pins, etc., with heads which move their eyes at the will of the wearer. The motor consists of a single pair of plates, either zinc and platinum or zinc and carbon, and can be carried in the waistcoat pocket. The carbon is fixed in a vessel containing a saturated solution of sulphate of mercury, which serves as the exciting liquid. This vessel is placed within an outer case, to the lid of which the zinc is fixed. The liquid fills only one-half of the vessel. As long as the apparatus is kept upright, there is no action; but when it is placed horizontally, the current is formed. The whole apparatus occupies but a small space; and costs, with the pin, from \$12 upwards.

REASON OF THE INTENSITY OF THE ELECTRIC LIGHT.—

The production of light by chemical action depends upon two conditions:—First, there must be solid particles in a fit condition to take up the motion; and, secondly, chemical action to impart the motion to them. The light produced by combined hydrogen and oxygen, is of itself feeble; but when it plays upon a piece of lime, that lime is sublimed by the heat, and the particles moving in the flame give an intense light; much more so, for instance, than the more slowly-moving particles of carbon in the flame of an oil lamp. It is to the more rapid motion of the particles in the electric light, that its greater intensity is due. The current passes through carbon pencils, particles from which are set in motion with inconceivable rapidity.

COMPOSITION OF GLASS FOR CHEMICAL APPARATUS.—

Professor J. S. Stas has found that ordinary glass is more or less soluble in nitric and muriatic acids; and that it gives up to them traces of the metals which it contains, even at ordinary temperature. It is, therefore, impossible to evaporate pure acid to dryness in it without a saline residue. Bohemian glass of the refractory sort, and other kinds which contain no alumina, but an excess of silica, will resist the action of hot concentrated acids; but the working of such glass is difficult. Prof. S. consequently instituted a series of experiments upon the subject, which resulted in the conclusion that a glass having for its base sodium and calcium, instead of potassium and calcium, is, if there is a sufficient excess of silica, almost as refractory as the Bohemian glass.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

73,340.—IMPROVEMENT IN WAGON AXLES.—Daniel Jones, San Francisco, Cal.:

I claim the countersunk collar, C, either in combination with the strap, D, or, when used alone, constructed and arranged substantially as and for the purpose described.

This invention is designed to provide an improved wagon axle, and to accomplish the same the inventor employs a countersunk collar, either with or without an arm extending along the axle, the effect of which is to strengthen the shoulder, where the square portion joins the part on which the wheel turns; he also employs a peculiar construction of the shoulder, by which said shoulder is materially strengthened, and rendered much less liable to break. Experiments with an axle made in this manner are said to prove that this axle will bear from one-quarter to one-half more weight than when constructed in the ordinary manner. In turning ordinary axles, the shoulder is turned up perfectly square, thus leaving a sharp angle at the point where the greatest strain is brought to bear. In this improved axle, the shoulder, by a peculiar device, is formed on a curve, whereby it is materially strengthened.

73,369.—IMPROVED EYE MEDICINE.—David R. Morgan, San Francisco, Cal.:

What I claim is the within described composition for treating the eyes, made of the ingredients enumerated and mixed or compounded in about the proportions specified.

This invention relates to a class of compounds for the radical cure of diseases of the eye, incident to the Pacific coast, and known as granules, which consist of pustules or excrescences of about the size of a grain of wheat, which attach themselves to the inner membrane of the eyelid, and produce great irritation to the eye, and which, sometimes, in cases of long standing, result in total blindness. To remove these granules, and effect a radical cure of these cases, as well as to provide a lotion and emollient for other classes of sore or diseased eyes, is the object of this invention. The lotion is prepared and sold by the inventor, and its utility has been fully proven by long practice of its use in this city.

73,391.—IMPROVEMENT IN CHAIN-INCLINOMETERS.—Hermann Schussler, San Francisco, Cal.:

I claim a chain-inclinometer, having the level, I, and the scale, A, A, together with the handle, I, I, I, for ascertaining the correct horizontal distance when measuring the whole, constructed and operated substantially as and for the purpose described.

This invention provides a chain-inclinometer, to indicate the amount of correction to be made on each chain's length, which can be employed for all engineering purposes by being attached to a surveyor's chain, and consists of three parts, to wit, the level, moving about a central point, which point forms the center of all the arcs of the scale, and, as the two sides of the glass are ground parallel, it can be used, if reversed, in chaining down a hill. The inclinometer can be detached from the chain, when it may be used in setting the slope of railroad embankments, dams, ditches, etc. Thus, by the use of this improved instrument, the difficulties of chaining on steep slopes will be, in a great measure, avoided. The whole length of the chain will be available, as there will be no necessity of leveling the chain, the inclinometer correcting all the measurements with absolute correctness.

73,397.—IMPROVEMENT IN STORE-TRUCKS.—Andrew V. Smith, San Francisco, Cal.:

I claim 1. The roller, B, brake-bar, E, brakes, C, C, holders, D, D, metal arm, H, and springs, c, c, when applied to store-trucks, substantially as and for the purpose described.

2. The cross-bar, I, handles, a, a, straps, b, b, ring, h', when arranged and operated substantially as described and for the purposes specified.

By this invention, a store-truck is so constructed that the wheels may be arrested at the will of the truckman, while ascending or descending inclines. In order to accomplish this, the inventor attaches a roller

transversely across the truck frame, back of the wheels. To each end of this roller is attached a brake. A brake-bar, with a spiral spring beneath it, is connected to the roller, passing up between the handles of the frame, on the end of which is placed a plate which works against the truckman, when he braces himself in going down inclines, and arrests the truck. A metal bar is attached to the side of the brake-bar, having a notch upon it, which catches on a pin to keep the brakes in place against the wheels. Below the handles is placed a movable cross-bar, operated by the bands of the truckman, by means of arms and leather straps, which lowers the brake-bar when loading the truck or passing up inclines. The wheels can be set, in loading the truck, so that it will not roll back.

72,819.—WASHING MACHINE.—Ellis W. Grove, Forest Grove, Oregon:

I claim the open dasber, consisting of the cross-bar, D, side pieces, a, and slats, b, in combination with arms, C, shaft, B, frames, F, cross-bars, d, uprights, b, box, A, and blocks, E, all arranged and operated as described.

72,931.—FURNACE FOR ROASTING AND TREATING ORE.—Charles Stetefeldt, Austin, Nev.:

I claim a furnace, constructed with a shaft, B, the fall of the ore through which is retarded by the upward motion of the heated air and chloridizing gases, combined with a fireplace, J, opening into the canal, H, and below the flue, D, substantially as described and for the purpose set forth.

72,982.—CARTRIDGES FOR SMALL ARMS.—Thomas Cullen, San Francisco, Cal.:

I claim the method and arrangement of securing the metallic base or cap a to the paper tube d, which holds the charge, by means of the nipple c screwing into the interior washer h, as substantially herein set forth and described.

73,020.—SEEDER AND CULTIVATOR.—Henry S. Matteson, Stockton, Cal.:

I claim 1. The beams, C, B, in combination with beams D, and cross-beams I, with draw-bar L.

2. The chest A, wooden shaft h, and iron slide i, in combination with crooked pin k, handle O, crank b, connecting-rod c, when used and arranged for the purposes herein specified.

73,160.—SLUICE BLANKET.—Abraham Block, San Francisco, Cal.:

I claim a sluice-blanket provided with woven ribs, substantially as herein described.

73,183.—CAR-AXLE BOX.—George H. Henfield, San Francisco, Cal.:

I claim the combination of the grooved caps e, e, the linings a, a, provided with pins c, c, and the shell A, A, arranged as and for the purpose herein described.

NEW INCORPORATIONS.—Articles of incorporation have been recently filed in the County Clerk's office in this city as follows:

PRINTERS' CO-OPERATIVE ASSOCIATION.—Feb. 19th. Capital stock, \$10,000; 20 shares, \$500 each. Trustees: J. F. Brown, John Cuddy, Geo. Crowell, M. McCarthy and W. B. Allen.

CENTRAL PACIFIC HOMESTEAD ASSOCIATION.—Feb. 19th. Capital stock, \$42,000; 120 shares, \$350 each. Trustees: Charles G. Noyes, Gilbert W. Haskell and J. B. Houghton.

SAN FRANCISCO MUTUAL HOMESTEAD ASSOCIATION.—Feb. 19th. Capital stock, \$24,000; 50 shares, \$480 each. Trustees: T. Welsh, M. A. Slaven, Robert Coulson, M. J. Donovan and Peter Lynch.

THE NORTH BLOOMFIELD GRAVEL M. Co. have filed a certificate increasing their capital stock from \$400,000 to \$800,000, also for the purpose of decreasing the par value of the shares from \$5,000 to \$100.

THE AMERICAN SPRING BED.—This bed is designed by a simple mechanical arrangement to take the place of the cumbersome and costly spring mattress in general use. It was patented August 7th, 1866, and has now been in use for a sufficient length of time to show its great excellence, if not decided superiority, over the ordinary spring bed. It furnishes a bed quite as flexible as hair, and so yielding and recuperative as to bring itself into place from indurture with great facility. It is said to be peculiarly adapted to the aged and to invalids. It may be seen at the company's depot, in the Mechanics' Institute building, 29 Post street. See advertisement in another column.

ANOTHER TREASURE DELUSION.—A Hazardville, Conn., correspondent of the Hartford Times says that a man by the name of Putnam, who states that he is acting under the direction of the spirit of Benj. Franklin, and has recently come from California, has set three gangs of men to work in that region at \$3 per day, to dig a subterranean passage to find a cave in which he declares some Spanish pirates deposited five million dollars' worth of diamonds and gold bars three hundred years ago,—having burned their ship at the mouth of the Connecticut river, and ascended the river in boats. There is a great excitement in the region, and multitudes of people from far and near visit the spot daily. The treasure is to be divided into fifths; one fifth for the owner of the land,—one for the Governor of the State, to be used for educational purposes; one for the Catholic Society, Boston; one for the Spiritualists; and one for Mr. Putnam. That is, of course, when they get it.

PETRIFIED FOREST.—Near the "tombs of the Caliphs," in the vicinity of Cairo, Egypt, is a perfectly barren and desolate region, where are found numberless fragments of petrified wood. The oak, beech, chestnut and others, none of which are now found growing in the country, are distinctly recognizable among these fragments; but scarcely a trace of the palm, sycamore, or fig tree,—which are the species at present indigenous to that region,—is found. The largest of these specimens is ten feet long, and one foot in diameter. The original color of the wood is well preserved. The perforations produced by the passage of insects through the bark are clearly visible, and a gummy secretion has been found in some of the holes made by them.

LECTURE ON WINE AND SILK.—W. Wadsworth, Esq., will lecture upon the wine and silk interests of California on Wednesday evening next, Feb. 26th, at the rooms of the Chamber of Commerce. He has been invited by the Chamber to repeat the lecture recently delivered before the State Agricultural Society, and also before the Legislature,—and which was highly appreciated by attentive audiences. The subject is a most interesting one, especially to those who have given a thought to the capabilities of the State in this direction. All are invited to be present. Lecture to commence at 8 o'clock.

PRODUCE AND COMMISSION.—The attention of our readers is called to the card of Messrs. Dalton & Blunt, well known produce and commission merchants of this city. They have recently removed from Washington to No. 406 Davis street. All produce consigned to their care will be promptly and efficiently attended to.

REMEMBER Dr. Benton's lecture Wednesday evening, at 7½ o'clock, at Dashaway Hall, Post street. You will hear some plain common sense upon the "healing art," and witness some wonderful feats in the way of psychology, or animal magnetism. Tickets only one dime.

CONSTRUCTION OF MINE SHAFTS.—Mr. H. T. Richardson, of Aber Hirnant, Bala, North Wales, proposes a "tubular shaft-casing and life-stair for mines, etc.," which consists of two galvanized iron tubes, placed concentrically in a shaft, with a flight of stairs between them; the inner tube is to be used as the "trading" shaft. The inventor remarks that entrances could be left to meet the requirements of galleries, great ventilation could be given to the mine, and a free way of escape would always be open to the miners in case of accident. The diameter of the tubes, would be regulated by the size of the shaft. The tubes are to be built in lengths of twenty-five feet; the extra strength of the lower sections would be regulated by the depth of the mine. The casing would strengthen the sides of the pit shaft and prevent any falls or giving way of the sides.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. Lutz, Secretary. Office, 306 Montgomery street, corner of Pine, San Francisco. 2v15

ANOTHER CALIFORNIA ENTERPRISE.—A Factory has been started in this city for the manufacture of AUSTIN'S CELEBRATED BRILLIANT PASTE BLACKING. This preparation not only produces a most brilliant polish; but, unlike imported Blacking, it is pronounced the best LEATHER PRESERVATIVE ever introduced. Trade supplied twenty per cent. less than any imported article. Factory, No. 1 Montgomery Court, near the corner of Broadway. 2v15-3m

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block, San Francisco. 5v16-am

Weekly Stock Circular.

Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,
February 24, 1868.

City Stocks.

City shares continue inactive, the attention of dealers being absorbed by the continued advancement of mining stocks. During the week under review Spring Valley Water Co. stock sold at \$60; at the close we quote it at \$58 bid and \$60 asked. A meeting of the stockholders of this company will be held on the 17th of March next, for the purpose of increasing the capital stock to \$8,000,000, to be divided into 80,000 shares of \$100 each. San Francisco Gas is steady at \$66. A few shares of North Beach & Mission Railroad sold at \$60, and Oakland Railroad at \$70. At the close San Francisco Gas stock sold at \$66 50 seller 3, and 200 shares of Nicholson Pavement stock at \$35.

At a meeting of the Directors of the Odd Fellows' Savings Bank, held on Monday evening, the 17th instant, Henry B. Brooks was chosen President; David Meeker, Vice President; Jas. Benson, Secretary, and Charles N. Fox, Attorney.

Mining Share Market.

During the past week the mining share market has obtained a still greater activity and prices have been vastly augmented. The developments in the Imperial mine, together with the prospects of the companies whose explorations will be made through the agency of the Imperial-Empero shaft; the very satisfactory developments in the Hale & Norcross, and the late discoveries in the Savage mine, have mainly contributed to the continuance of the general rise; however, the merits upon which advances are based, in quite a number of claims, are certainly not very tangible. Many have realized very handsomely on their investments, and this, together with the easy condition of the money market, has brought in those who usually refrain from dealing in mining stocks.

The shipments of bullion, during the week ending February 15th, from Wells, Fargo & Co.'s office at Virginia, Nevada, amounted to \$114,478, and from the Gold Hill office to \$35,125.

SAVAGE—was exceedingly active, rapidly advancing from \$143 to \$195, and closing at \$198 buyer 30. During the week ending Feb. 15th, 1,714 tons of ore were taken from the mine, showing an approximate value of \$58,511, or \$34 14 per ton. This shows a slight improvement over the previous week. In the south mine, on the fourth level, the ore—both the breast and the drift going south from it—is said to be very good. A telegram of the 20th inst. states that they struck ore in the north drift, on the 5th station, but have not yet ascertained its extent. This is about one hundred and twenty feet north of the main tunnel. The north drift, same level, runs in hard ground. A telegram, dated Feb. 21st, 11 A. M., states that they have developed three feet of fair ore in the north drift, on the fifth station.

HALE & NORCROSS—Owing to this stock being at present held for election purposes, it has been nominally suspended from the list. On the 15th instant one foot sold for \$2,700, seller 40. Mail advices to the 17th instant state that they had opened the sill floor of the 930 level a distance of 115 feet, and have raised five floors, all of which are said to look well. In drifting northward the ore is not so good; however, the openings above the sill floor are said to look much better than the sill floor itself. The ore now being extracted will average from \$36 to \$37 per ton, and the first ore mined will, it is thought, run over \$40.

CROWN POINT—gradually advanced from \$1,600 to \$1,900 seller 10, and closed at \$1,900. It is expected that the retimbering of the shaft will be finished to-day, and that work will be resumed on the 800 level before the first of March. From the fact that about five feet of water has been found on the 700 level, they expect to cut a body of water in drifting on the 800 level. The shipments of ore on the 15th and 16th inst., amounted to 77½ tons, showing a 65 per cent. assay value of \$37 96.

IMPERIAL—was dealt in to a considerable extent, rising to \$280, then selling at \$270@290, and at the close realizing \$270. The new body of ore through which a drift is now being run lies on the south line, 210 feet west of the shaft, and 185 feet below the surface, or 45 feet above the track floor of the 230 level. It is thought that the entire deposit will mill about \$25 to the ton. They have drifted a considerable distance

upon it, but so far no estimate can be given of the amount likely to be found in this locality, since it is seventy feet farther west than any work ever done in the mine. In opening north and south on this ore, it is reported to look well. On the 17th inst., the guides for the cages had been placed a distance of 240 feet from the bottom of the shaft, and one compartment of the shaft was to have been completed by the 19th inst. They expect to commence drifting to-day—by the way, a very auspicious day to begin. The receipts of bullion to date for the current month amount to \$22,650.

KENTUCK—sold at variable rates, opening at \$307 50, declining to \$260, and on Thursday advancing to \$300. The receipts of bullion for January account are stated at \$92,914 26. Empire advanced from \$245 to \$275, and closed at \$270 seller 30.

CHOLLAR-POTOM—has been less active than usual, advancing from \$190 to \$225, and closing yesterday at \$212 50. The slump is now being made preparatory to opening the station for the incline. At present the Blue Wing station yields about fifteen tons of ore per day. On the 16th inst., 88 tons of ore were shipped, and on the 17th, 110½ tons.

GOULD & CURRY—met with more than usual inquiry at an advanced price, rising from \$500 to \$850, dropping to \$650, and closing at \$630. We have no news whatever to warrant the recent advance in this stock. YELLOW JACKET rose from \$995 to \$1,240, and at the close sold at \$1,210. The *Trespass* of the 15th inst., says that "the pump has been lowered to the bottom of the new shaft, which has been drained of 110 feet of water since Thursday morning. Sinking for a new level will be commenced at once, and unless something in the shape of new ore fields be opened, in the expressive language of one who knows, 'somebody will be hurt.'"

OVERMAN—sold quite freely during the week, but toward the close, when the price ran up to \$200, holders were not disposed to sell; however, yesterday it reached \$215, and closed at \$200. C. A. Luekhart, mining engineer, who has made an elaborate report upon this mine, sums up as follows: Ore at 300 level and above, 7,560 tons, valued at \$17@24; between 300 and 400 levels, 6,400 tons, valued at \$24@25 per ton—making a total of 13,960 tons of \$23 or \$24 ore. This report is dated February 14th, and a letter of the 16th, says that the ore on the 361 level (Uncle Sam ground) is improving in quality, showing by assay \$53 per ton. ALPHA sold at \$1,250@1,475. BELCHER at \$270@360. OPHIR rose from \$62 50 to \$190 seller 30, closing yesterday at \$150. Nothing of importance from the mine.

EXCHEQUER—was inquired for at an advance, rising from \$29 to \$38. SIERRA NEVADA sold at \$15@18 50, and closed at \$20. SEGREGATED BELCHER at \$10 50@18, closing at \$19. BULLION at \$45@70, closing at \$60. LADY BRYAN at \$30.

GOLD HILL QUARTZ—is quiet; a few shares selling at \$93 50@100. DANEY realized \$14 per foot. The annual meeting of the stockholders of this company will be held on Monday, the second day of March next, for the purpose of electing a Board of Trustees to serve the ensuing year.

JULIA—located east of the Comstock Lode, levied an assessment of \$2 50 per share, payable since the 18th inst. This stock has not been in the market for a long time past.

AMADOR—sold at \$225. This mine continues to produce handsome returns, and its monthly dividends are as regularly and uniformly disbursed as those of the Bank of California.

The sales in the Board during the past week have been as follows: Regular sessions, \$2,180,298; open sessions, \$682,722—total, \$2,863,020; making an aggregate of \$7,056,186 during the current month.

ERRATUM.—In the item headed "Vital Force," in our last issue, for "American Chemistry" read "Animal Chemistry."

C. MULLER, Optician, 205 Montgomery street, has been appointed sole agent for the improved Eye Sharpener, patented by E. B. Foote, M. D.

POSTMASTERs are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

San Francisco Prices of Copper Ores.

SAN FRANCISCO, Feb. 21, 1868.

We give the following as an approximate price at which copper ores can now be sold in this city. There is no sale for ores which assay less than 12 per cent. The late reduction in price is on account of the advance of freight:

	Per ton.		Per ton.
12 per cent. ore.....	\$16 00	22 per cent. ore.....	\$43 56

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

CALIFORNIA.

Alpine County.

Miner, Feb. 8th: Pay ore has been again found in the Tarshish. In a tunnel, running from Monitor creek to open up the continuation of the Tarshish deposit south, ore was struck, early this week, both hard and soft, which is identical with that found in the original strike. Several small pockets of decomposed ore turned out sulphurets, which upon assay by Mr. Lewis Chalmers gave results as follows: From pocket No. 1, the silver sulphurets had evidently partially dissipated from exposure to a free seam, as the assayed showed a value of silver \$134.07; gold \$568.89; total \$1,002.96 per ton. From another pocket farther in and surrounded by firm rock, the assay gave as follows: of silver per ton 1,329.4 ounces, value \$1,714.92, gold 10 ounces, value \$413.40; total value per ton \$2,128.32. An assay of hard ore gave of silver 119.6 ounces, value \$154.41, gold 2.2 ounces, value \$45.46; total value per ton \$199.87.

The Mt. Bullion property has passed into the hands of London capitalists. They intend to push work on the mine as fast as possible.

The lateral tunnel of the Monitor Consolidated Co. now in 30 ft., already shows, among the decomposed substance in which it is running, ore which assays \$20 to \$30 per ton.

Amador County.

Jackson Ledger, Feb. 15th: The east drift in the Union mine is now in 70 ft. The ore is unusually good, and contains a large per cent. of sulphurets.

Dispatch, Feb. 15th: Two mills are now running on rock from the Mahoney mine. The Co. have purchased the old Wildman mill, and are getting it repaired, preparatory to placing it on the mine. The mine is capable of furnishing ore for 80 stamps. Five days' run of the chlorination works gives a clean up of \$1,500.

The proprietors of the Oneida mine had a clean up this week amounting to \$1,000, which was cast into a brick by P. Reichling.

Calaveras County.

Chronicle, Feb. 15th: Since the cessation of the rain, work has been commenced on all the claims in this vicinity. The most favorable reports are received from all sections of this mining district.

Markwood & Co., proprietors of the old "Gopher" claim at Buckeye, are doing exceedingly well.

Mr. Peters, in the same district, is also taking out some rich gravel from his tunnel in Red Hill. Mining interests in that vicinity are in a more prosperous condition at present, than they have been before for years.

Times are lively at Cat Camp and vicinity. The mining region is proving to be much more extensive and richer than was at first supposed. Claims are paying all the way from \$4 to \$20 per day, to the hand. People are flocking in from all directions, and that entire region of country is being taken up for mining purposes.

The "Palomo" mill is kept constantly running. Some very fine rock is being taken from the shafts.

San Andreas Register, Feb. 15th: Mr. Thorn has again begun driving his shaft down, and the quartz is more flattering in its appearance than it has ever been. The lode seems to widen, though it grows more solid. At the northern end of the claim, the vein has been struck, and the quartz is proving satisfactory. The extension on the other end of the Thorne claim will be worked in a few days. Mr. Gottschalk and his company have found what is supposed to be a parallel vein, some 200 yards north-easterly of the Thorne vein, which prospects exceedingly well. The quartz, on the surface, is a white, burnt-appearing, soft rock, but contains a great deal of fine gold.

Inyo County.

Esmeralda Union, Feb. 9th: Charles Duval, who passed through Aurora a few days since, informed us that the mines at Lone Pine, Inyo Co., Cal., were never looking better, and those worked were paying well. He reports about a foot of snow, which was so unlooked for that no preparation whatever was made for the unexpected intruder, consequently, mining operations have been retarded. He also reports that good surface diggings have been struck, 50 miles south of Owens Lake, but the Indians are represented as being so hostile that it would be useless for small parties to attempt to prospect.

Mariposa County.

Gazette, Feb. 15th: Bogan & Co. are getting the timbers on their mill site, at the Pedro Goza mine, for the purpose of erecting a quartz mill. A turbine wheel will be used for the driving power. When the weather opens, the machinery will be moved from Colorado, and operations will be commenced in earnest.

The J. B. Sanders vein, about 1½ miles west of Coulterville, on Red Bone Gulch, and recently purchased by R. Jones and James Piper, will be worked in the spring by the present owners. This vein has been very rich in gold. There are two or three other mines near Coulterville, that are being prospected at present.

Nevada County.

Transcript, Feb. 15th: The rock taken from the Pittsburg still continues as rich as ever. They have now opened on both ends of the lead and find the rock good throughout. Some beautiful specimens from the mine may be seen in the cabinet of the National Exchange Hotel.

Feb. 19th: Union Hill a year ago was a very lively mining camp, with several mills in operation and a large number of men employed. Now all the mines are shut down, and none of the mills are at work except the one owned by Layton & Co. which occasionally runs upon custom rock. Some of the companies talk of resuming soon, and others are patiently waiting for the time when mines can be worked at less expense.

Gazette, Feb. 13th: The Enreka Co. of Grass Valley, has declared a dividend of \$20,000 for the four weeks ending Jan. 30th, payable at San Francisco.

Feb. 19th: Great activity prevails among the miners at Birchville and vicinity. The companies are all at work, and are either making money or have fine prospects ahead. The Granite Co. clean up on an average once in 25 days, and the yield is at the rate of about \$150 a day. The Kennebec Co. use 400 in. of water, and their last clean up, after a run of seven days yielded \$4,500—an average of over \$650 a day. Sloan & Co., owners of the American claims, have recently commenced operations, with the best prospects of large results. Furth & Co., owners of the San Joaquin claims, use 400 in. of water and are doing well. The Irish American and Don José Cos. have leased their claims to a company of Chinese who run 250 in. of water to each claim. They are said to be making money very rapidly. The Buckeye claims, between Birchville and Sweetland, owned by Evans, Stidger & Co., are in the full tide of successful operation. They are taking out a larger amount of gold than any other company on the ridge. Several of the clean ups last year yielded as high as \$24,000—each run of 40 days costing the company about \$10,000. Some of the owners have refused to sell their interests at the rate of \$75,000 for the whole ground.

At French Corral, mining operations are carried on with the greatest energy and activity. That place and Birchville are at present the most active mining centers on the Ridge, and the prospects are favorable for a long season of prosperity. At French Corral, there is a broad, deep stratum of rich cement underlying the hydraulic ground, which will afford employment for hundreds of stamps for many years. Eddy & Co., whose claims cover 75 acres of ground, employ 20 men, and use 1,500 inches of water. In one run of 30 days they cleaned up \$30,000. The claims of Schardin, Bell & Co. adjoin the Eddy's. They have a large bed of cement, which they are now crushing—the mining being done by white men, while Chinese are employed in packing away and piling up the boulders. Adjoining these are the claims of Crittenden & Co. They are slicing off the surface, and at the same time erecting a mill to crush the cement. The machinery for the mill is mostly on the ground. Burke & Co. have eight men steadily employed, and run 400 inches of water. The Glaister claims employ four men, and are yielding well. Ayer & Co. employ three men, have three pipes, use 200 inches of water, and are now working to open their ground. The Slow and Easy Co. (Sullivan & Co.) use 100 inches of water, and are making money. The Dockum Co.—composed of a party of Frenchmen—have four pipes, run 400 inches of water, and in the past two years have cleared \$33,000. Their claims are extensive, and will last many years.

Excelsior.—Virginia *Enterprise*, Feb. 18th: A gentleman from Meadow Lake informs us that the snow in that vicinity is only about 7 ft. deep. About 100 persons are now in that section. The Enterprise Co. are going ahead with both mine and mill. One run on what is called second-class ore paid, by roasting, \$50 per ton.

The Mohawk & Montreal Co. are also at work.

Placer County.

Herald, Feb. 15th: We were presented this week with a handsome piece of quartz, taken from a new claim being prospected by Capt. Mallett, beautifully studded with pure virgin gold. This specimen, with many others, was obtained within 4 ft. of the surface, and indicates that the ledge is indeed rich.

Our surrounding hills are swarming with quartz miners and prospectors, and nearly every one has his "pockets full of rocks," every rock showing free gold to the naked eye.

Willment, Mallett & Co. are preparing to work their claim near Auburn.

Dutch Flat *Enquirer*, Feb. 15th: Kidder & Co., at Squiers' Cañon, have sunk three shafts on their claim, and have met with satisfactory results. We learn that a large number of miners in and about Squiers' Cañon intend to commence work during the coming week.

Wolcott & Wells have commenced hydraulicing in their claim at Squiers' Cañon, and they have prospects of a bounteous harvest of gold.

Rollins & Co. are ready to commence washing in their claim as soon as their pipe, which is now on the ground, is laid.

The King Bros. cement mill at this place continues to yield a respectable profit. Their last clean-up, on Saturday, netted the company \$10 per day to the hand.

Messrs. Bakers, owners of a cement claim in this place, have contracted with Smithwick for the construction of a set of arastras on their ground, for the purpose of prospecting the same, preparatory to putting up a mill.

Auburn Stars and Stripes, Feb. 13th: The old Flag mill, near Doty's Flat, is soon to be removed to Auburn Ravine, below Ophir, where it will be enlarged, and supplied with all the appointments of a first-class mill.

Sacramento County.

Folsom Telegraph, Feb. 15th: A colony of Portuguese miners have taken possession of Maine Flat, opposite this town, and claims once abandoned are made to pay well through their industry.

From all sections of the mining regions in this vicinity we hear favorable accounts. In the neighborhood of the Western House particularly, the miners are doing well, and expect to do much better hereafter.

Shasta County.

Courier, Feb. 15th: The owners of the quartz ledge on McCall Gulch, Dog Creek, are making preparations to commence taking out rock for shipment below in the spring. The rock sent below some time ago paid \$50 to the ton, and much richer rock has been struck since that was taken out.

Last fall the Parks brothers went up on Arbuckle, and set to work prospecting for a winter claim. They finally selected a piece of ground, rigged up a hydraulic pipe, and set to work as soon as they obtained water. We understand that the enterprise has been abundantly rewarded, and that they have already taken out a large amount of gold dust, and have realized as high as \$140 for one day's panning.

Sierra County.

Downville Messenger, Feb. 15th: The Brush Creek mine continues to develop as rich as ever. Machinery is now being constructed to put up a good mill on the mine in the spring.

The Docile is still paying at the rate of 25 pounds per week, from the upper tunnel. Parties were in town last week recording late discoveries near Kanaka Creek.

The Enreka correspondent writes: Most of the ditch owners have, during the past ten days, had a lot of men at work repairing flumes and removing obstructions, to have them ready for the water season.

There are but few men at work mining at present.

The Nevada *Transcript* of Feb. 19th, speaking of the Docile ledge, says: Mr. Smith, who came from the ledge on Friday last, brought with him 20 pounds of specimen rock, which was estimated would pay \$100 to the pound, or nearly one-half gold. A piece of the rock was broken in the presence of our informant, who says he should think it was more than one-half gold, and was taken out within six feet of the surface. A large quantity of this specimen rock has been worked in hand mortars and not less than \$20,000 has been pounded out in this way alone. Mr. Smith has one piece on exhibition at his store which is valued at \$1,000. The ledge is spotted and it is evident these specimens came from a pocket, although the rock which is worked by mill process is paying handsomely.

Yuba County.

Marysville Appeal, Feb. 12th: Great ex-

citement exists among the miners at Smartsville and vicinity concerning the "jumping" of claims, attempted by Ackley, Cray and O'Brien, by their location known as the Smartsville Hydraulic Mining Co. A miners' meeting was held, and it was declared that all claims located back of the front claims should not be considered forfeited by reason of not being worked, unless the claims in front of them should be washed or worked out; also that all claims having work done on them to the value of \$50 shall not be subject to forfeiture at any time hereafter. The meeting also provided for having all the claims in Sucker Flat district surveyed and mapped by a competent surveyor.

ARIZONA.

Miner, Jan. 18th: At latest accounts from the Chase lode in Hassayampa district the ledge was 5½ ft. thick, and the rock as good as ever.

Last week, Mr. Reed worked in a Moore pan four tons of tailings of Sterling rock, out of which he got \$140, or \$35 to the ton. These tailings had been previously worked or manipulated four times. With a horn-spoon, scarcely a color could be got out of them.

A party of placer miners, who have been at work in the Hassayampa for some time past, recently struck pay-dirt, out of which they picked pieces of gold weighing from one bit to a dollar. The dirt in which they found so much gold is a sort of mushy loam.

The Plumoso lode, in the bed of the Hassayampa, is still being worked. The Coloradians who found it are engaged in taking the rock out and working it, and the results obtained by them are flattering. Every ounce of metal taken out is worth \$5, and it takes but a short time for them to get an ounce.

Yong & Roddick, owners of the Chanee lode, were down upon it 60 ft. when the water drove them out. They have commenced to sink another shaft, and have made arrangements with Mr. Reed to have several tons of Chance ore worked by him at the Sterling mill. They have several ounces of amalgam in their cabin, taken out by themselves.

N. Z. Pierce and Charley Taylor are still working on their mammoth wheel, which will be 30 ft. in diameter. They expect to be able to run six arastras with it.

Lato news from Wickenburg state that the Vulture is running, and that business is brisk.

Jan. 25th: The miner's of Walker's district are taking out lots of gold. Jackson McCrackin is working a ledge that pays from \$40 to \$60 to the ton, free gold. Alfred Shupp and Jake Linn are running the Johnson water arastras. Other parties are also running arastras, and doing well. Last week, Shupp showed us about \$600 of as pretty gold dust as we have ever seen, which he took out of rock crushed by him in arastras.

Joe Yong stepped into our office yesterday evening, and exhibited the proceeds of 100 lbs. of Chance ore. Said proceeds nearly filled two yeast powder cans.

Work on the Chase is progressing. We saw one day this week a piece of rock from this lode, which was more than half gold.

Mr. W. C. Reed has succeeded in getting over \$100 to the ton out of unassorted rock from the Sterling lode.

COLORADO.

Georgetown Miner, Jan. 23d: An assay made recently by Dr. Munson, at the Denver Mint, of ore from the new Philadelphia lode, gave a return of \$381.72 silver per ton. The shaft on the lode was about thirty feet deep at the time of our last visit. The ore bears a striking resemblance to the ore from the celebrated Terrible lode, carrying a little less zinc blende and more galena than the latter. The gangue of the two veins is precisely alike.

Work has been resumed on the east shaft of the Nuckoll's lode. This shaft is now down 85 feet.

The lode recently discovered by Richard Simmons, near the foot of Sherman mountain, is proving itself one of the best in the country. It has been named the "London" lode.

Vigorous operations still continue on the Baker mine, at West Argentine. Work in the adits is being pushed night and day and a large amount of ore is being brought to the surface.

Work has been resumed on the Georgetown tunnel.

Jan. 30th: While in Denver we were shown several specimens of gold bearing quartz from Granite district. The mines there are rich in free gold, the ore being black iron cubes so rich as to have a bronze appearance. The quartz varies in color from a light gray to a rich dark brown. Nothing but the ordinary stamp mill pro-

cess is necessary to insure rich returns and those who get such machinery earliest into the district will reap rich profits.

Garrott, Martine & Co. are putting an engine in their works. The cold weather having induced them to depend no longer on water for power.

We have it from good authority that reduction works on a large scale will be erected here soon. It is the intention to have them in operation early in the coming autumn.

We recently saw a beautiful specimen of argentiferous galena and sulphuretted ore, from the General Marion lode, on Leavenworth Mountain, near the Argentine lode.

C. Marble, has started a tunnel in Columbia mountain, for the purpose of striking at a great depth, and working some valuable property on that mountain.

A man in digging a foundation for a house, near the base of the mountain, just below the Alpine Co's mill in this town opened up a fine silver lode. The ore is said to be first quality.

Messrs. Clark & Crow, have shown us some splendid specimens of ruby silver taken recently from the Terrible lode. The ore grows richer as the shaft descends.

A new lode has been discovered on Griffith mountain, near the Comet, that shows some very fine sulphuretted and argentiferous galena ore on the surface.

The Silver Dream, a lode recently discovered, about 50 ft. above the Lilly, and at the depth of three feet, has a rich ore vein four inches in width. Three pounds of this ore, tested by C. S. Stowell, Esq., gave a result of \$532 in silver, coin value, to the ton of ore.

Denver News, Jan. 20th: We were shown to-day, two choice specimens of argentiferous galena ore, from the Bunker Hill and Independence lodes, in Beven district, Summit county. They are the largest specimens of the kind that we have seen. The ore from the Bunker Hill, weighing 200 pounds, and that from the Independence lode, 400 pounds. Assays made from the ore prove it to be of great richness. The specimens will be shipped to Boston, Mass.

Central City Register, Feb. 4th: Blake, McClurg Bros., and others recently leased the old Peck & Thomas claim, at Gregory Gulch, and almost immediately broke through into a two-foot vein of pyrites, thickly studded with native gold. Mr. Kenyon began running ten cords of Pewabic ore, yesterday.

Mr. Van Doren has commenced work on the Fairfield Co's property, with the view of leasing it should he be able to make it pay under present conditions. Some 2½ cords of ore, crushed by Mr. Perogriue at Black Hawk last week, produced 14 ounces. Mr. Beach last week took up 175 ounces of gold from three days' run of 25 stamps. The rock came from ground within 60 feet of the surface.

DACOTAH.

The Reese River *Reveille* of Feb 8th publishes a letter from the Sweetwater mines dated Jan. 26th, from which we extract the following: Two new districts have been formed west of this toward the head of Sweetwater, and many new quartz locations have been made in this and California districts. The gulches, as far as prospected, have proven better than we thought they would. Fifty claims of 200 feet each have been located in Atlantic gulch; and of these 10,000 feet are below the ledge, all of which it is thought will pay down to claim No. 20 as much as \$10 to \$15 per day; but up near to the ledge the pay will be better. There is a small gulch on Atlantic creek, which has all been located and prospected, and which pays 25 to 50 cents to the pan. There are three to four ft. of dirt. The Bridger Co's claim has been opened 40 ft., and the ledge has been cut through and proves to be 20 ft. wide, with pay rock all the way. The decomposed part, next to the foot wall, prospects 75 cts. to \$1 to the pan. The Atlantic stands No. 1 in the whole country, and we are going over in a few days to put up a house and do two or three weeks' work on that and the Mammoth ledge. We opened the latter west of our old shaft, and found an eight ft. ledge looking better than in the old shaft. For both quartz and placer mines the country looks favorable; the quartz ledges look better as they are prospected, and the gulches are proving better than we anticipated.

Nevada *Gazette*, Feb. 12th: A company of adventurers recently started from Virginia City for the Sweetwater mines, parties in this county are also preparing to leave for the same destination early in the spring, and the indications are favorable for a grand rush of miners to that region next season. It bids fair to be in 1883 the El Dorado of the restless prospectors, as Gold Bluff, Kern River, Fraser River, Washoe and Reese River have been in years past. A few days

since we received a letter from a friend who went to Sweetwater last October. He has devoted the most of his time for the last 15 years to prospecting, with poor success, but tells us he has struck it at last. From his representations, ledges have been discovered containing remarkably rich rock. The first discovered was the Cereso, in June last, by Henry S. Redell. Four tons of rock from this ledge hauled to the mill at Springville, this side of Salt Lake, yielded \$7,000 a ton. The yield may have been greatly exaggerated, but it must have been large, for the owners are taking out the rock and having it hauled 500 miles to be crushed, and are making money. Two or three other ledges are referred to, the owners of which are crushing the rock in hand mortars, and making from \$5 to \$20 a day to the man.

Silver Bend Reporter, Feb. 8th: Quite a number of our nomadically inclined citizens are making preparations for an early trip to the gold mines of Dacotah, in the hope of there realizing their dream of life.

IDAHO.

Owyhee *Avalanche*, Feb. 8th: Rich gold and silver mines have been struck in the bottom of the shaft in the Potosi mine. We noticed on the dump a couple of tons just taken out, and it was truly a goodly sight to look at. In much of it could be seen pure crystallized silver, and also gold. The rich streak is from 12 to 14 inches in width, besides broken veins on each side that indicate a large ledge of solid quartz at a greater depth.

Yesterday we saw at McDonald & Co's assay office two gold and silver bricks, valued at \$10,900. They were extracted from Ida Elmore ore, worked at the Lincoln mill and was the result of five days' straining, leaving by far the richer portion of the amalgam in the battery. Many more quartz mills are wanted to work our mines. Enough quartz could be taken out of those now being worked to supply double the number of stamps running in Owyhee. There are a great number of rich mines here that will remain idle next summer because of the scarcity of means for working them.

MONTANA.

Post, Feb. 1st: The indications are that the Crow Creek mines at Radersburg, will be a lively mining camp in the spring. There are several tributary gulches where good pay is found, and the bars prospect well. About 2,000 claims are recorded. Three ditches, it is thought, will supply all the water required. Two of these are already completed, the third will be by the 1st of June. The diggings are generally shallow, but on Johnny and Charlie gulches the ground is deeper, and several companies are drifting this winter. It is believed there is good even pay over a large extent of gulches and bars, and prospecting is going on quite briskly.

The Union mill has received a gold brick weighing 240 ozs. as the result of a seven days' run with 25 stamps.

Sixteen hundred ozs. of bullion were received from the Esler, Argenta, Smelting Works, on Tuesday evening. The bullion is principally silver, but having been reduced from top quartz, contains some gold.

The Phillipsburg correspondent writes: Several tunnels have been commenced, two running at different angles on the Camanche Hill, one under the Cliff Hill and one upon the St. Louis Mill Co's mill site near the central portion of Phillipsburg, intended to tap the Cordova lode, and for discovery purposes. The work upon the former is in progress. The St. Louis Mining Co's mill, since the holidays, has not disturbed our peaceful slumbers. Old quartz men predict that much the largest average runs will be made from the Cable rock yet made in the Territory. Another mill will be placed on the Alexandria lode in the spring.

A. Barber, writing to Mr. Byam of Virginia, gives the following, concerning operations at Argenta. The Esler smelting and cupel works are running satisfactorily. Ores are being smelted from several different leads, and all are paying. I was at the furnace a few evenings since, when a 70-lb. chunk of silver was taken out. To-night, or to-morrow, a very large piece will be taken out, as there is 10,000 lbs. of rich lead in the charge. Another cupola is being erected as fast as possible, and it is the intention to add one after another until there are five in the row—the same power for furnishing a blast being adaptable to all. The second furnace has been let out to contractors for \$450, Mr. Esler furnishing the material.

NEVADA.

Black Rock.

Virginia *Enterprise*, Feb. 14th: It is now quite certain that the Black Rock mines, so much lauded a few months since, are quite worthless. The mills erected in the district have not been able to save even a trace of the precious metals in working many tons

of the ore. The mills already erected will be taken down and removed, and those ordered in California will not be brought up—the orders having been countermanded. Much money has been fruitlessly expended in these Black Rock mines first and last, and some very singular assays and results by mill process have been reported. It appears to us that there has all along been something rotten in that region besides the ore—a sort of clay.

Esmeralda.

Union, Feb. 18th: Mining operations have been partially suspended on the Silver Champion, Palmetto district.

The Piuo Grovo correspondent writes: Two mills, of 10 stamps each, and one steam arastra are kept busy night and day working ore, and a third is in course of construction by Messrs. Toombs & Abrahams. The latter is expected to be in working order within 60 days. The Wheeler Co. will, within a week, have finished a run of 500 tons of ore worked at the Pioneer mill, which will average from \$40 to \$50 per ton. Judging from the appearance of the ore in sight in this company's mine there will still be left from 600 to 1,000 tons of rock equally as good if not better.

Wilson's first run in his new mill of 50 tons of rock from his mine, turned out better than he expected. The run was made up of second and third class rock which he estimated would pay from \$12 to \$15 per ton, but the clean up showed an average of \$36 per ton. His mill is now making a run on 75 tons of ore taken from that part of his mine leased to Toombs and Abraham. The ore is taken from a vein at least 12 ft. thick, and will pay \$50 to \$60 per ton. Abraham has just returned from Virginia City where he went with the bullion from 40 tons worked in Crosman's arastra. The brick made from the bullion was valued at nearly \$2,000, showing an average yield of \$50 per ton.

The Midas Co. will soon commence taking out ore for another run. On the 12th of January, Supt. Bourne exhibited a brick worth \$15,000 to the Virginians, and the company declared a third dividend of \$8 per foot.

Virginia *Enterprise*, Feb. 15th: E. Ruhl-ling & Co., assayers, yesterday received from Pine Grove a lot of 450 ozs. of gold bullion valued at about \$7,000. About \$1,300 of this amount was extracted from ore from the Wheeler and the remainder from the Wilson mine. The ore was worked in the new Wheeler mill, its first run. All the mines that are opened are looking well.

Humboldt.

Unionville *Register*, Feb. 1st: The amount of refined bullion shipped from the Montezuma smelting furnaces, for the year 1867, amounted to \$48,192, and the amount of crude bullion on hand the first of December, 1867, amounted to \$63,037, making a total yield for the year of \$111,229. This yield is the result of not more than four months steady running during the past year.

The Manitowoc mine is yielding largely, and looks better than ever before. The mill is kept constantly running.

Fall & Co. shipped yesterday 800 ozs. of bullion. Value, \$1,000.

The Dun Glen correspondent writes: Owing to the state of the roads, the Essex mill has not yet been completed. The Essex mine has suspended work for the present. The mine looks well, and operations will shortly be resumed again. The Empire mine will be put in running order as soon as the weather becomes favorable. The Monroe Series is progressing very favorably. It is one of the richest and best developed gold-bearing quartz ledges in the State. Twenty-eight tons of the rock, crushed at Holt's mill, in Winnemucca, produced \$5,508, and the tailings will probably yield a good remuneration.

Feb. 15th: Gov. Fall has purchased the Etna mill from the Nevada Co. in New York, and will remove it to Unionville at an early day in the spring.

Pahrnanagat.

Reese River *Reveille*, Feb. 13th: We saw a collection of ores to-day from Pahrnanagat district, which would add to the credit of the best district in the State. A number of the larger and finer specimens were from the List and Illinois ledges. The specimens from the List were of marked character, and resembled the best class of ore produced in Hot Creek, Reveille, and Empire districts. It contains a fair proportion of the mineral Stetefeldtite, which is the chief bearer of silver in those and other districts in the southeast. Several pieces of ore were taken from one of the walls of the List, which were as smooth as ivory or polished marble.

Feb. 15th: The 10-stamp mill in process of erection at Hiko, in the district of Pahr-

nanagat, for a New York company, will be opened shortly.

To-day we saw at the office of Boalt & Stetefeldt five certificates of assay of ore from the List ledge, the principal vein in the district, which show a remarkably high average. No. 1 yielded at the rate of \$448.96 of silver per ton; No. 2, \$213.68; No. 3, \$207.40; No. 4, \$160.26; and No. 5, \$125.70. The samples were procured from the surface and down to the depth of 75 ft., the lowest opening in the mine.

Reese River.

Reveille, Feb. 8th: J. W. Bailey, agent of the Centenary Co. in Newark district, shipped to-day to New York 12 bars of silver bullion, valued at upwards of \$14,000.

The superintendent of the South American mine is sinking a vertical shaft for the purpose of running levels at a considerable distance below those last opened.

Feb. 10th: The property of the Savage Consolidated Co. on Lander Hill, consisting of mining and blacksmith tools, and the ore dump containing 2,000 tons of low grade ore, was recently sold by the sheriff for \$500.

Feb. 12th: The mill of the Twin River Co. in Ophir Cañon has been stopped for repairs, and the placing of new pans. In the meanwhile, the mill will be supplied with salt from the Lone Mountain marsh.

Feb. 13th: Preparations will be begun shortly for sinking a vertical shaft in the ground of the Timoko Co. It will be sunk in the hill several hundred feet above the mouth of the incline through which the mine has been principally worked.

Silver Bend Reporter, Feb. 8th: In Palmetto district all work save that done by two or three of the oldest residents has been suspended. Horace W. Barton and Frederick Conn are making preparations to develop the New York ledge the coming spring. The Dixon Co. also intend to resume labor upon their mines early in the spring. The owners of the Kentucky ledge have taken the proper steps to secure a patent for their mine under the Act of Congress of July 26th, 1866, after the issuance of which work of the most thorough kind will be commenced. The Kentucky is a fine looking vein, carrying an abundance of mineral, and has been opened to a considerable extent. The most extensive operations carried on in Palmetto district have been by the New York and Silver Peak Co., which has several locations in the district.

The Austin correspondent of the Virginia *Enterprise* of Feb. 4th, says: Working tests of assorted ore from the Buckeye lode in Summit Cañon, have been made with excellent results—10 tons yielding \$300 per ton, six tons \$260 and four tons \$230. There are now 400 tons of fair milling ore on the dump, and as the reliability of the mine has been proven, the company intend to build a 15-stamp mill early in the coming summer. The Eclipse is likely to become the property of the Buckeye Co., as a negotiation for its purchase is now under consideration. The Newark mill has closed for want of salt. A batch of 14,000 ozs. of bullion arrived in town two days ago, being the clean-up of a 14 days' steady run. This is at the rate of \$100 a ton for the ore worked.

The same correspondent writing to the *Enterprise* of Feb. 14th, says: In Santa Fe district 23 miles south of Austin, on the eastern base of the Toyabe range, are situated the mines of the Yosemite Consolidated Silver Mining Co., a San Francisco incorporation. They consist of six ledges located in 1864, most of them being on the dividing line between a gray silicious limestone and a dark colored slate. Though considerable surface work has been done, none of the lodes can be said to be developed. The greatest depth attained on the Yosemite No. 1, which is the most promising of the six veins, is little over 40 ft. This lode is six to seven feet wide at that depth, but is not all pay ore. On the foot wall there is a streak 15 inches thick which gives a pulp assay in the mill of \$140 to \$150. The next 24 in. is milling ore of \$70 to \$75 grade, and the balance of the vein matter is a mixture of clay, slate and quartz. The ledges all show fair milling ore of low grade—that is, as the ores in this region are classified—ranging by mill assay from \$60 up to \$150 per ton. Several batches of selected ore worked in Austin recently, gave encouraging returns, 1½ tons assaying \$226, one ton \$147, two tons \$91, and 2½ tons \$73. Quite a number of men are idle owing to the stoppage of work in outside districts. The Combination mill started up on Friday last.

Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, Feb. 5th: The proprietors of the Petaluma mill, Lower Gold Hill, have purchased the boilers formerly belonging to

(Continued on Page 120.)

Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1867.

Mr. C. T. Raney is our duly authorized agent for Sacramento County. Nov. 29, 1867.

Mr. L. G. Yates is our duly authorized traveling agent. July 18, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 16, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

OUR NEW YORK AGENCY.—Mr. M. A. LATROPP, formerly of California, is our authorized Agent in New York. Parties in the Eastern States who desire to subscribe for or advertise in the MINING AND SCIENTIFIC PRESS, can address Mr. L., at No. 726 Broadway, for the present. Nov. 26, 1867.

San Francisco:

Saturday Morning, Feb. 22, 1868.

Notices to Correspondents.

MINER, Clayton.—The fatal accidents occurring to miners while following their occupation, are far more numerous with those engaged in mining for coal, than those employed in obtaining metals of all kinds. The inspector's reports for Great Britain for the year 1866, disclose the fearful facts that during that period, 1,484 men lost their lives by violence in and about the 3,192 collieries of Great Britain last year. In 1865 the number of lives lost was 984, showing an increase of 500 deaths in 1866. For every 67,887 tons of coal raised a life was sacrificed. The number of men employed in the collieries of Great Britain was 320,663. Out of the 1,484 deaths in 1866, 651 occurred from explosions of fire-damp. The deaths from this cause alone in Great Britain in the ten years ending 1865 were 2,019. The total number of deaths from all violent causes in the ten years was 9,916, about 20 per cent. of which was caused by fire-damp explosions. The number of deaths from falls in mines in 1866 was 361; from accidents in shafts, 162; from accidents underground, 203; and from accidents above ground, 107. Of the deaths from fire-damp, 361 occurred in the Oaks Colliery, 91 at Talk-o'-the-Hill Colliery, and 38 in the Victoria Colliery, in Dukinfield.

ONE ANXIOUS.—To this correspondent, as to several others, who have at various times forwarded communications requesting to know when it was probable that the new mode of amalgamation and reduction alluded to in our columns, about three months ago, was likely to come into operation, we have to give the following general reply, which, at the same time, we trust will be accepted by several of our interior exchanges, who have also commented on the subject. The chief and most influential parties, who had promised to see the matter alluded to carried into practical operation, were compelled to withdraw from the undertaking in consequence of being unable to obtain the assent thereto of their partners, occupied in different branches of business. It is probable, therefore, if the promised improvements are to be carried out at all, it will have to be done almost wholly by the influence of those interested in mining operations. We are informed that it is not unlikely but the whole matter will be in the course of two or three months brought prominently before the public.

FOR EXTERNAL POISONING BY CYANIDE OF POTASSIUM.—As this article is now being extensively used in this State, the following may be worth noting. The foreman of the gilding department of the American Watch Works writes to the Boston *Journal of Chemistry*, that the most effectual remedy for the painful and troublesome ulcers which it produces upon the hands of those who use it, is, according to his experience, the proto-sulphate of iron (copperas) in fine powder, rubbed up with raw linseed oil.

THE YOSEMITE BILL.—The Senate has followed in the wake of the Assembly, and passed this bill over the Governor's veto.

"Dynamit"—The New Blasting Powder.

We made a brief mention last week of some experiments with the new blasting powder, which has recently been introduced into this city from Hamburg, Germany, where its mode of manufacture is said to have been discovered about a year ago. This powder is evidently very similar in its composition and effect to the terribly effective nitro-glycerine;—it appears in fact, to be nitro-glycerine itself, in a solid, instead of a fluid form, or rather the fluid material mingled with and absorbed by some porous non-explosive substance, such as charcoal, sawdust, or some similar article, by which it is rendered comparatively safe under the application of ordinary percussion, while it may be burned without explosion, when spread out or laid loosely in the open air. It is readily exploded when closely packed within powerfully resisting walls, and its action under such circumstances is terribly effective. The explosion is produced by a small charge of fulminate, such as a percussion cap of that kind, fired by a fuse, in the midst of the charge. Whatever the material of this new explosive compound may be, it is evidently a much safer agent to handle than nitro-glycerine, or even than gunpowder; unless, like the former, it may be subject to uncertain and unknown chemical changes, by the lapse of time or change of temperature. Yet we are yet aware that any such objection exists.

Its safety from accidental explosion may be inferred from the fact that while the agent was preparing his experiments at Lime Point, he had a lighted cigar in his mouth most of the time. At the time of making his first experiment, when about to place the charge in the cannon ball, he opened a small box (about the size of a common yeast powder box) filled with the explosive compound. The bystanders, noticing his cigar, immediately began to fall back; when, to satisfy them of their safety, he took up a little of the powder from the box, which he had placed upon the ground, spread it upon a piece of paper and applied his cigar to it; it burnt very much like damp powder, setting the paper in a blaze. All this took place in the open air within eighteen inches of the open box of explosive compound, and 200 people standing round! A few minutes after, less than half an ounce of the powder from the same box burst the 42-pound shot into atoms, without even a paper wad being placed upon the top of it, a thing which could not have been accomplished with the best of gunpowder except by securing the charge with a closely fitting screw plug. The powder is slightly damp, and when tamped lightly packs very close; in which condition alone, and when confined, it is destructive.

The vast importance to the miner of a safe and effective blasting powder, is a matter of the very highest moment, and for this reason much interest is attached to all inventions relating to the manufacture of that indispensable agent; especially is this the case when additional advantages are obtained over ordinary blasting powder, without a corresponding increase in the cost of production. The experiments at Lime Point show that to obtain its fullest effect, this new powder must be confined within firm inclosing walls. The effect upon the rock is crushing rather than scattering—it lifts more, but does not throw as much as common powder. But little smoke appears to result from its burning, and so far as we are aware, no very deleterious gas is produced. It does not require a hole or chamber more than one-quarter the size of common powder to produce an equal effect in hard rock. The amount of labor saved thereby in drilling, is a most important consideration.

Such evidence would seem to imply a most important advantage in all underground work. There were quite a number

of practical miners present, all of whom, so far as we could learn, expressed themselves decidedly favorable to the new powder, and were anxious to give it a trial. Of course time alone can fully test its value and safety, and as a manufactory will be immediately put into active operation in this city, all who so desire will soon have the opportunity to test it for themselves. The powder is flocculent in appearance—like sawdust, of a reddish-brown color, easily compressible into flakes between the fingers, and moist to the touch. Its taste, and the effects of the same, is precisely like that of nitro-glycerine. It can be furnished cheaper, in proportion to the amount of its effectiveness, than common powder. It is called "Dynamit or Giant Powder."

Interesting Exhibition

A very interesting exhibition of some of Nature's hidden mysteries, is now being made at the S. E. corner of Montgomery and California streets, in this city. This exhibition consists of a large number of massive slabs of sandstone, upon which have been pictured, by the hand of Nature, views, as it were, of natural landscape scenery—here undulating plains covered with a dense growth of shrubbery, and there, lofty and abrupt mountain heights and slopes, as though they were the photographic representations of adjoining scenery, covered with dense miniature forests. These stones have been termed "photographic rocks." They are obtained from a locality in El Dorado County, known as Pleasant Valley, and situated about thirteen miles southeast from Placerville. They were first discovered by a party of hunters, two or three years ago—a small outcrop only being seen. Specimens from the same locality were exhibited at the last State Agricultural Society.

The right to excavate, market and utilize these rocks, was subsequently purchased by a company now known as the El Dorado Landscape Rock Co., of which Mr. S. Fleming is agent. The Company has got out a large quantity of this rock, and sawed it into slabs about four inches thick, as now exhibited. In prosecuting this work, Mr. Fleming has uncovered a face of the deposit from four to six feet high, and about seventy-five feet long. It is cut off at either end by ravines; but is supposed to run back into the hills for an indefinite distance, possibly two or three miles. The pictured stratum of sandstone rests perfectly horizontal in position, upon a bed of soft steatite, and is about four feet thick, so far as opened. Superimposed upon this sandstone, but separated from it by a seam of silicious clay, a few inches in thickness, rests a deposit of infusorial rock, exactly corresponding in character, with the exception of its coloring matter, to the "electro-silicon," which is now being sold in this city as a polishing powder. This layer is a little less in thickness, so far as uncovered, than the sandstone layer, and like it is covered with the picturesque representations, as above described, only finer and more delicate in character. This last characteristic is due to the fineness of the grain of the material—the sandstone being quite coarse and harsh to the touch, while the infusorial rock consists of a slightly indurated mass of impalpable powder; silica being the main component of both.

We have said that both layers are pictured; but it is somewhat remarkable and quite inexplicable, that while the tops of the pictured trees and shrubbery of the sandstone hang down, like the shadow of a tree in water, the corresponding pictures of the upper layer of infusorial material stand upright, in a natural position. When in position, the one is, as it were, the shadow of the other!

SPECULATIONS WITH REGARD TO THE ORIGIN OF THESE PICTURED REPRESENTATIONS.

These "pictures" are generally supposed

to be the result of the infiltration of manganese and iron, in a state of solution, among the interstices of the grains of sand which compose the rock—such infiltration taking in an arborescent form of crystallization, precisely similar to that which is often found in the seams or interstices of slate, and other rocks; only that in this case the intrusive substance is spread out so as to form the perfect representation of a tree or shrub within the body of the stone, while in a seam, only a flattened or sectional representation can be seen. The arborescent appearance in these sandstones is precisely like that seen in a beautiful and clear moss-agate, with the only exception that the lines are coarser, owing to the coarseness of the grain of the stone. That, however, is not the case to such an extent in the upper layer or infusorial deposit, where the grain of the stone is reduced to an impalpable powder. In this the "pictures" are as delicately formed as in the agate.

Another theory has also been suggested, that this miniature sylvan scenery now pictured upon the rocks, was once an actual plant growth, upon and into which the silicious formation was subsequently precipitated through aqueous agency, and that the "pictures" are merely the carbonaceous remains of that former vegetable growth. There are several objections which may be urged against this theory; one of which is the fact of the inverted positions of the "pictures" in the lower stratum (which would serve rather to sustain the infiltration theory); another objection would be found in the apparent total absence of anything like the debris of an earlier or partially decaying and fallen vegetation.

These "pictured rocks" certainly form a very interesting study for the geologist, and we presume, that since they have now been brought so prominently to the notice of the public, through the enterprise of Mr. Fleming & Co., that we shall soon hear from some one able to more fully enlighten the world upon such matters. In the mean time we would recommend those curious or interested in the more mysterious works of Nature, and all others, in fact, to go and see this unique exhibition. We understand that one of the objects of the company is to see if these remarkable rocks can in any way be utilized in the arts. We see no reason why they might not be made highly ornamental in heavy stone panel work. Perhaps some of our enterprising builders will try the effect of such an experiment.

DR. LIVINGSTONE.—At the Meeting of the Royal Geographical Society, London, on Nov. 25th, a letter was read from Dr. Kirk of Zanzibar, which stated that a native had been brought to him who had returned from the interior, and who had seen a white man in one of the villages near Marungu, accompanied by thirteen blacks. Dr. Kirk showed the native his albums of photographic portraits. The first book contained a fine side view of Dr. Livingstone. The native did not recognize it as the man whom he had seen in the interior. But the second book contained a staring likeness of Dr. L., which had been kept as a caricature. To this the native at once pointed, saying, "That is the man!" Dr. Kirk, however, had suspended opinion until he could confer with the other men who were with the native at the time the white man was seen. Marungu is 650 miles inland, and the time was about the end of 1866.

TITLE TO A QUICKSILVER MINE.—A dispatch, dated Chicago, Feb. 21st, says: The House Judiciary Committee has had for some time under consideration the petition of William McGarratan, asking to have confirmed to him the title to Parishes Grandee, a mineral tract in California, one of the richest quicksilver mines known. It has heard numerous lengthy arguments on both sides, and will soon report, confirming the old Mexican title, under which McGarratan claims, upon his paying the minimum price of the mineral lands.

British Mining Educational Institutions.

In order to render as complete as possible an account of the various mining educational establishments in different countries, the following brief history and description of the School of Mines of London, and other smaller and scattered institutions of similar character in other parts of Great Britain, has been furnished, at our request, by our fellow citizen Prof. Rowlandson. Professor R. was not only personally acquainted with the original director of the Royal School of Mines, the late Sir Henry de la Beche, but was also in familiar intercourse with all the original professors, a full moiety of whom still continue to hold the same professional chairs. From his known tastes, enthusiasm and deep acquaintance with many of the most recondite parts of geology, particularly in their relation to metallic veins, as well as the most economic modes of utilizing their contents, Professor R. enjoyed the privilege of access to the magnificent museum of the Institution about to be noticed, even on days when the public was excluded, and also to the various lectures, although not a student. From such intimate acquaintance with its origin and founders, the following account from his pen may therefore be considered a fair synopsis:

BRIEF HISTORY.

The inception of a British National School of Mines did not receive a definite form until a very short time before its public institution. Outside of those immediately intrusted or indispensably connected by their public position with the carrying into effect of such an institution, the writer believes he was about the first person of the general public to whom this design was privately communicated by the late Sir H. de la Beche. Like many other institutions, it grew to its present condition, slowly in its infancy, but rapidly as it outgrew its swaddling clothes.

In the year 1835, while occupied under the ordnance department in making a geological survey of Cornwall, the late Sir H. de la Beche suggested to the then Chancellor of the Exchequer, that a collection should be formed, and placed under the charge of "The Office of Works" of "specimens of the various mineral substances used for roads, in constructing public works or buildings, or otherwise employed for useful purposes, or from which useful metals could be extracted, and that such collection should be arranged with every reference to instruction."

A locality was found for the deposit of specimens, in which specimens poured in abundantly, especially from Cornwall, who "one and all" greatly assisted. The collections, including models of mines and mining machinery, accumulated rapidly. The collection continued to augment by presents and the exertion of the Geological Survey, so much so that the rooms originally occupied became insufficient for their reception, in consequence of which the adjoining office, then occupied as the Earl Marshal's office, was added thereto. A curator, the late Mr. Richard Phillips, F. R. S., was appointed, who being also qualified, performed at the same time the duties of chemist. When however the Geological Survey and the Museum of Practical Geology were combined, it was first denominated the Museum of Economic Geology, the necessity of proper accommodation became so pressing that it was finally resolved to erect the building in Jernyn street, in which is now located the "Royal School of Mines."

These collections were divided and designed not as mere assemblage of specimens, calculated to strike only the vulgar or uneducated eye from their brilliancy, color, or singularity of form, but to be instructive with reference to the especial object of each department, and to become useful as illustrations, when teaching by lectures or other means. In order to render these collections available to the general public, the museum is open the three first days of the week. For the instruction of visitors, succinct treatises are furnished for a few cents a copy for each division. A ceramic and a vitreous collection, each of great value and interest, also occupy limited portions of the museum. Under the existing conditions of California, these may be dismissed from present consideration. The paleontological collection, consisting of fossils

belonging to both the animal and vegetable kingdoms, is the finest in the world. The metallic series is arranged so as to show the various ores of the different metals, their mode of occurrence in the earth, the methods employed in their extraction, and the means used for rendering them marketable,—at which point the labors of the miner terminate, and those of the metallurgist commence. The last named are also fully illustrated, and the qualities of the different metals, either alone or mingled as alloys, are carefully arranged so as to exhibit in the most instructive manner their various applications in the arts and manufactures.

The collection of the modes of occurrence of ores are extensive, and are arranged so as to be the most effectively instructive. In this class also are exhibited the models and drawings of various machines employed in draining mines, and the manner of raising and dressing ores. It may be briefly mentioned that the geological positions of coal, and the modes adopted for mining that valuable mineral, occupy a very conspicuous place; more limited in extent is the series illustrative of the formation of rocks at different geological epochs, and the changes which have occurred since their deposit, some of which possess a high economic as well as scientific interest, as a particular example of which may be mentioned that change called "cleavage," which is best studied in roofing slate, owing to its great durability when divided along the plane of cleavage as compared with rocks, divided along the line of lamination corresponding with the planes of their deposit.

THE ROYAL SCHOOL OF MINES.

Soon after the building in which the present School of Mines is located was resolved upon, suggestions were thrown out to those in authority as to the advantage that would be derived by the establishment of a School of Mines. Whilst these negotiations were pending, the writer had several conversations and interviews with the late Robert Stephenson and Sir Henry de la Beche, as to the most appropriate locality for such a School, to the last Mr. Stephenson always contending that Truro, the county seat of Cornwall, was the most desirable. The final result, however, was that the authorities, and I think wisely so, decided on fixing upon the metropolis as the fittest locality, after all things *pro* and *con* had been fairly weighed. The building being erected, the museum being collected, and all the first professors excepting Dr. Percy, being already attached to the Geological Survey, it required little preparation to put the conception into actual execution. Sir Henry de la Beche the chief director, was consequently enabled to deliver the inaugural address on the 6th Nov. 1851, which was followed by introductory ones by the various professors, the respective chairs being then filled as follows: 1—Chemistry, Lyon Playfair, C. B.; 2—Metallurgy, John Percy; 3—Natural History, the late E. Forbes; 4—Mineralogy, Warrington W. Smyth; 5—Mining do.; 6—Geology, A. C. Ramsay; 7—Physics, R. Hunt. The only change since that period have been the substitution of A. W. Hofman in place of Lyon Playfair, Mr. Huxley for the late Edward Forbes, the establishment of a professorship of "Applied Mechanics," at present filled by Professor Willis, and the substitution of Professor Tyndall to fill the chair of Physics in the place of Mr. Robert Hunt, who still continues to fill the office of Recorder of Mines. Instruction in mechanical drawing is given by the Rev. J. Haythorne Edgar, M. A. The successor of Sir H. de la Beche as director of the School of Mines and Geological Survey, is Sir Roderrick Murchison, Bart.

The fee for students desirous of becoming associates is \$150, in one sum, on entrance, or two annual payments of \$100 each, exclusive of the laboratories. Pupils are received in the Royal College of Chemistry (the laboratory of the School) under the direction of Dr. Hofman, and in the Metallurgical Laboratory under the direction of Dr. Percy.

Tickets to the general public to separate courses of lectures are issued at from \$15 to \$20 the course. Officers in the Queen's service, Her Majesty's consuls, acting mining agents and managers, can obtain tickets at very much reduced prices.

Certificated schoolmasters, pupil teachers, and others engaged in education, are also admitted to the lectures at reduced fees. Before the first course of lectures were completed, the late Prince Albert as Trustee of the Prince of Wales, endowed two Scholarships out of the revenues of the latter as Duke of Cornwall, and it is stated

† Mr. Stephenson was occupied for five years in the superintendence of the Columbian Gold Mining Co., New Grenada.

that others of a similar character have since been established. I have no record of what these scholarships are, but to the best of my recollection, (I was present when Sir H. de la Beche announced the circumstance), they were equal to \$150 per annum for two years, respecting which I may have occasion to refer hereafter.

MECHANICS' INSTITUTE.

SAN FRANCISCO, Feb. 15, 1888.

To W. B. Ewer, Chairman of the Nominating Committee—Dear Sir:—The undersigned, members of the Mechanics' Institute, San Francisco, most respectfully tender through you their cordial support to ANDREW S. HALLIDIE, as nominee for President on the Regular Ticket, to be voted for at the coming election in March.

We take this somewhat unusual mode of procedure, owing to a fear that, being on the Committee to nominate for the regular ticket, Mr. Hallidie's well known modesty and reserve would prevent his accepting the nomination at the hands of his associates.

Reposing the utmost confidence in his integrity and ability to honorably fill the position named, we ask you to give the nomination publicly, in the name of the Committee.

Yours truly,

J. W. Gale, D. E. Allison, H. C. Bunker, Jr.
Robert Hall, Geo. E. Childs, Wm. J. Stoddard,
And 110 others, whose names have been published in the daily papers.

REGULAR TICKET.

Election, Monday, March 2, 1888,
FROM 12 M. TO 9 P. M.

At Rooms of the Society, No. 29 Post st.

§3—The undersigned Committee, appointed by the members of the Mechanics' Institute at its annual meeting, held February 6th, 1888, for the purpose of nominating officers for the ensuing year, have the pleasure of presenting to members for their approval the names of the following gentlemen.

In selecting your nominees, the Committee, in obedience to the voice of the members, have presented to each candidate for his endorsement the following questions, which have been fully approved by them:

1st—Economy and retrenchment in all matters relating to the affairs of the Institute and its proposed Industrial Exhibition.

2d—A individual and collective effort to afford instruction to junior members and apprentices by means of classes, lectures, increase of library and other available means.

3d—Faithful support to the principles of Eight Hour labor.

4th—To engender friendly and kindly feeling between members, especially in debates.

5th—Hearty and indefatigable co-operation in insuring success in the forthcoming Fair; voluntary services by Executive Committee, no member of which shall have direct or indirect interest in any pecuniary transaction arising therefrom.

W. B. EWER,

C. R. STEIGER,

M. W. SPAULDING,

C. F. BASSETT.

For President,

A. S. HALLIDIE.....Wire Rope Manufacturer.

For Vice President,

The Photographic Landscape Rock.

The Eighth Wonder of the World!—A
Puzzle for Geologists!

On Exhibition at the

S. E. Corner Montgomery and California Sts.

THE EL DORADO PHOTOGRAPHIC LANDSCAPE CO. have on exhibition, at the southeast corner of Montgomery and California streets, a number of LARGE SLABS of the PHOTOGRAPHIC LANDSCAPE ROCK, from the famous quarry at Pleasant Valley, El Dorado County. Some of these slabs are two feet long and three feet wide, and they are PAINTED BY NATURE, IN COLORS, with landscape views, which run through the rock, being the same on both sides of the slab, no matter how thick or how thin. These landscapes look as if they were photographs of the adjacent mountain scenery, representing mountain ranges, hills, forests, high rocky points, lakes, caves, sea beaches, and plains. There are also pieces which look like the Grain of Wood.

Geologists acknowledge that nothing has been found elsewhere of the same kind, and they are unable to explain its formation. ADMISSION, 25 CENTS. Open Day and Evening. 8v16m

KNICKERBOCKER

Life Insurance Company,

OF NEW YORK.

Assets, - - over \$3,000,000.

Number of Policies issued in 1887, 10,800.

Amount insured, - - \$31,375,671 00.

POLICIES ISSUED AT ONCE,

On receipt of Application at the San Francisco Branch Office, without referring to the Home Office at New York.

Policies Paid in Gold Coin or Greenbacks,
at the option of the person insuring.

[Extract from report of the Home Office, for Dec. 1887.]

"The Company's history for the past fifteen years shows favorably, and it stands to-day ranks it among first-class companies. It has carried out in good faith every contract made by it, never counting a Southern claim during the war, while it is well known that many of our largest companies repudiated their Southern risks at the commencement of our National struggle, thereby increasing their assets. This honorable dealing of the Knickerbocker in the past, is a pledge of its future good faith."

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

ENGINES.—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

BOILERS. Locomotive, Pac, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

PUMPS.—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

AMALGAMATING MACHINERY.—Wheeler & Randall's Improved Tractory Curve Pan, Zeiss's improved flat bottom pan, Beldin's pan, Ventell's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills. Settlers of all descriptions, Retorts of all sizes and shapes for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

OIL BORING TOOLS AND MACHINERY.—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screws, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH & CO. G. W. PRESCOTT. IRVING M. SCOTT.

[MINING SUMMARY—Continued from Page 119.]

the Sides Co., and day before yesterday removed them to the mill, where they are to replace two old boilers now in use.

Feb. 11th: The machinery of the new Imperial-Empire hoisting works is working finely. The shaft will probably be drained of water to-day, when drifting will at once be commenced on the 900-ft. level. It is calculated that the lead will be reached in drifting west from the shaft about 140 ft.

Feb. 12th: The Overman Co. have resumed work on their mine.

The Kentuck Co. yesterday declared a dividend of \$15 per foot, payable next Saturday, 15th inst.

Feb. 13th: Mr. Day of the Golden Eagle mill, Dayton, and John Rule of Gold Hill, have made a most important discovery of a quartz ledge on the Carson river. It is about three quarters of a mile below the San Francisco mill, and half a mile above the Franklin and Island mills. The ledge is plainly traceable a long distance, and 100 ft. in width. The croppings assay over \$100 to the ton—mostly in gold, and 1,000 lbs. of it, put through mill process by Mr. Day, he was confident would yield at least at the rate of \$20 per ton.

A new boiler is being put in the Sunderland mill, Lower Gold Hill.

Yesterday the new pump of the Yellow Jacket mine started up. Everything is in good order.

Feb. 14th: Part of the pumping machinery for the Imperial-Empire mine, at Gold Hill, arrived in this city night before last. One spur wheel weighs over 9,000 lbs.

The new mine lately discovered on Carson river has been named the Champion. One and a half tons of top rock from the lead, worked in the Eagle mill, yielded at the rate of \$21 per ton.

Feb. 15th: The total amount of bullion shipped from this city and Gold Hill during the past week was 6,021 lbs., valued at \$149,603.03.

A great deal of prospecting is at present being done in the outcroppings of abandoned mines lying from one to five miles eastward of the great Comstock lode, and in many instances paying ore has been found upon and near the surface. In Silver Star district ore has lately been found that assayed at the rate of \$50 per ton for selected ore. There will doubtless be some valuable discoveries made in our old abandoned mines during the coming summer. In Castle district, north of the city, are many very large leads, crowned in most instances with huge masses of croppings, that have been abandoned for five or six years. In the vicinity of a number of these, shafts have been sunk to a depth of from 100 to 200 ft. and in some instances tunnels of considerable length were driven in. In most cases an influx of water put an end to operations on the shafts before the leads for which they were started were reached, and few of the tunnels were ever driven in far enough to tap the veins toward which they were directed.

Feb. 16th: It is reported that the workmen in the Imperial mine, Gold Hill, day before yesterday struck a large and new body of ore, in the 230-ft. level, west drift.

NEW MEXICO.

The Central City (Col.) Register has the following in regard to the Cimarron mines: Mr. Nash, one of our best known mill-men, has just returned from the Cimarron, and tells a doleful story of the prospects of the mines there. So far as he could judge from prospecting and from the experience of others, the placers resemble somewhat those of Bear river—gold in slight quantity from the surface some distance down, then a hard clay a great depth with not even the color in it. The whole country is at present buried in snow.

Rocky Mountain Herald, Jan. 21st: Reports from the Cimarron mines are not very enticing at present. The want of water is principally complained of; gulch mines are good, some of them paying \$50 a day to the hand, while the greater number are unable to be worked from the scarcity of water.

SUBSTITUTE FOR MEERSCHAUM.—It is said that if potatoes are peeled, macerated for about thirty-six hours in water to which eight per cent of sulphuric acid has been added, well washed with water, dried in blotting-paper, and then in hot sand for several days, on plates of chalk or plaster of paris, which are changed daily, being compressed at the same time, an excellent imitation of meerschaum, answering well for the carver or any purpose not requiring a high temperature, will be obtained. But this is not all, for if after the potatoes have been thus treated they are further hoiled in a solution containing 19 per cent. soda, a substance resembling stag's horn, and which may be used for knife-handles, etc., will be formed.

ESTABLISHED [MAY, 1850.]
VOLUME SIXTEEN

Mining and Scientific Press, COMMENCING JANUARY, 1868. **DEWEY & CO., Publishers.**

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansone, San Francisco.
Terms in Advance.—One year, \$5; Six months, \$3; Single copies, 15 cents. Monthly Series, \$5.00 per year, 65 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

The Mining and Scientific Press is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

College of California.

Department of Chemistry,

UNDER

PROF. W. B. RISING.

The Laboratory has recently been fitted up so that each student will be supplied with a set of Chemical Reagents at his own desk.

The Course of Instruction will include a thorough drill in Qualitative Analysis, and advanced students will be furnished every convenience for Quantitative Analysis.

Attention will be given to the detection and separation of poisons.

Also, instruction in the Assay of Gold, Silver, Copper, Lead, Mercury, and other Ores.

Students from abroad, prepared to proceed with the class in the studies of this department, may be admitted on application to the Professor in charge.

SULPHURETS;

What they are;
How Assayed;
How Concentrated;
And How Worked;
With a Chapter on the
BLOW-PIPE ASSAY OF MINERALS.

By **WM. BARSTOW, M. D.**

Published by A. Roman & Co., San Francisco.

For sale at this Office.—Price, One Dollar.

With the aid of this Book, the miner can assay his own ores, requiring but few materials, etc., except such as are generally to be found in the interior towns.

Japanning!

EQUAL TO ANY AT THE EAST, DONE ON ALL KINDS of Hardware and Carriage work. Damaged Goods repaired; Sewing Machines Japanned and Ornamented.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—*Yreka Union.*

MOSHEIMER'S

Pioneer Mining School,

ASSAY OFFICE

—AND—

Metallurgical Works,

SAN FRANCISCO.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

1.—Assaying of Ores, Metals, and other Mineral Substances.

2.—Metallurgy of Gold, Silver, Copper, Lead, etc., by Smelting, Amalgamating, Lixivation, etc.

3.—Gold Extraction, by Chlorine Gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.

4.—Concentration.—Dressing of Ores.

5.—Construction of Furnaces, in which any kind of fuel may be used for Smelting, Roasting, etc., as well as the erection of any Machinery or Apparatus required in Metallurgy and Technology.

6.—Technology, or Chemistry as applied to any special branch of Manufacturing.

By my Practical Mode of Teaching, any person of ordinary ability can learn to assay Ores in three lessons, and the working of all the ordinary and refractory ores in a few weeks.

Gentlemen of almost every profession, who, within the last two years have graduated at my establishment, will bear testimony that from my instructions they have learned more in a few weeks than they ever expected to learn.

My charges are from \$50 to \$200.

Ores of every description assayed and worked

New Mining Advertisements.

Fogus Mill and Mining Company.—Location of Works: Anador County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of February, 1868, an assessment of ten dollars per share was levied upon the capital stock of said Company, payable on the twentieth day of February, 1868, in United States gold coin, to the Secretary, at his office.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of March, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the ninth day of April, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN J. SCOTCHLER, Secretary.
Office, No. 321 Front street, San Francisco. feb22

Great Central Mining Company.—Location of Works: Yuma County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the nineteenth day of February, 1868, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of March, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the fourteenth day of April, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

O. D. SQUIRE, Secretary.
Office, No. 302 Montgomery street. feb22

I. X. L. Gold and Silver Mining Company.—Location of Mine: Silver Mountain District, Alpine County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of February, 1868, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at his office, Pioneer Hall, (up stairs) Montgomery street, near Jackson, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of March, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fifteenth day of April, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. CROWNSHIELD, Secretary.
Office, Pioneer Hall, Montgomery street, up stairs, San Francisco. feb22

Mount Tenabo Silver Mining Company.—Location of Works: Cortez District, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the ninth day of January, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Hell, Thomas.....	109	50	\$125 00
Clayson, H. H.....	47	12	30 00
Clayson, H. H.....	91	8	20 00
Burnham, Charles.....	63	100	250 00
Gardner, F.....	124	75	97 50

And in accordance with law, and an order of the Board of Trustees, made on the fifteenth day of January, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Secretary, 609 Market street, on Monday, the second day of March, 1868, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. S. SWEET, Secretary.

Office, 609 Market street, San Francisco. feb15

Illegal Supplemental Advertising.—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

Hope Gravel Mining Company.—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-eighth day of January, 1868, an assessment (No. 20) of one dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to David Wilder, Secretary, at the office of the Company, No. 533 Kearny street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the seventeenth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.
Office, No. 533 Kearny street, corner of Sacramento, San Francisco, California. Office hours from 12 to 2 P. M. feb1

Kearsarge Mining Company, Kearsarge District, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twentieth (20th) day of January, 1868, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, 408 California street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

T. B. WINGARD, Secretary.
Office, 408 California street, San Francisco. feb25

La Bionca Gold and Silver Mining Company, District of Ures, Sonora, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the second day of January, 1868, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A. Alexander.....	424	1	\$2 50
C. B. Richard & Sons.....	522	48	120 00
Benjamin Fishel.....	354	1	2 50
Benjamin Fishel.....	279	5	12 50
Louis Levy.....	201	6	12 50
Louis Levy.....	344	2	5 00
Louis Levy.....	395	4	10 00
Isaac Michaels.....	375	5	12 50
H. Newman.....	431	1	2 50
R. Newman.....	433	10	25 00
Richard Pinckney.....	113	6	15 00
Richard Pinckney.....	316	1	2 50
Conrad Stolze.....	85	10	25 00
Conrad Stolze.....	87	10	25 00
Conrad Stolze.....	309	4	10 00
Henry Holm.....	385	5	12 50

And in accordance with law, and an order of the Board of Trustees, made on the second day of January, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Monday, the seveneenth day of February, 1868, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WM. SIEVERS, Secretary Protem.
Office, Nos. 312 and 314 Front street, San Francisco. feb1

Postponement.—The above sale is hereby postponed until Monday, the twenty-third day of March, 1868, at the same hour and place. By order of the Board of Trustees.

WM. SIEVERS, Secretary Protem.

Nacra Secora de Guadalupe Silver Mining Company.—Location of Works: Tayoltita, San Dimas District, Sonora, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 30) levied on the third day of January, 1868, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
John Bohn.....	67	10	\$10 00
John Bohn.....	173	5	5 00
H. Burdorf.....	191	10	10 00
H. Burdorf.....	192	15	15 00
Theo. Cebler.....	194	55	55 00
John L. Smith.....	198	10	10 00
And of formerly unassessable stock—			
John Grel.....	167	75	75 00
M. Kirsch.....	139	60	50 00
F. Rand.....	161	20	20 00
F. Wagner.....	176	5	5 00

And in accordance with law, and an order of the Board of Trustees, made on the third day of January, 1868, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Badger & Chapman, auctioneers, N. W. corner of Kearny and California streets, San Francisco, California, on Tuesday, the third day of March, 1868, at the hour of 1 o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. J. PFEIFFER, Secretary.
Office, No. 210 Post street, San Francisco, Cal. feb15

Oxford Beta Tonoel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of February, 1868, an assessment (No. 25) of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of March, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth day of April, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

CEO. H. BECK, Secretary.
Office, 212 Clay street, San Francisco. feb15

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-third day of January, 1868, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-sixth day of February, 1868, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixteenth (16th) day of March, 1868, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.
Office, 318 California street, up stairs, San Francisco. feb25

Postponements and Alterations.—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be handed in as early as possible.

Rippon Gold and Silver Mining Company.—Location of Works: Silver Mountain Mining District, Alpine County, State of California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the seventeenth day of December, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Machinery.

VARNEY'S
PATENT AMALGAMATOR

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY.

San Francisco.

SUPERIOR CUT-OFF ENGINES.

We desire to call the attention of Engineers, Manufacturers, and Millmen, to the celebrated

Hartford Engine,

With Wright's Patent Variable Cut-off, which we are now manufacturing under a license from the Woodruff & Beach Iron Work Co., Hartford, Ct. To parties wishing a First-class

Fuel-Saving Engine,

Simple and durable in construction, this Engine is offered in the belief that it is superior to any other manufactured. It enjoys the very highest reputation in the Atlantic States, where it is well known; over 300 of them having been built by the Woodruff & Beach Company, and being now in successful operation.

GODDARD & CO.,

Pacific Iron Works,

San Francisco, Aug. 23, 1867.

BLAKE'S QUARTZ BREAKER!
PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

—BY—

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077

Sv15r

SAN FRANCISCO.

DR. BEERS' PATENT
WIRE GAUZE AMALGAMATOR.

THE ATTENTION OF QUARTZ, HYDRAULIC AND Placer Miners, is called to this new invention for saving Fine Gold. It is designed to furnish the miner with a clean and simple apparatus by which the finest *free gold* can be saved without loss, requiring little attention, no machinery to drive it, and will positively collect every particle of amalgam, or of waste mercury that may have escaped from mill or sluice, and as these particles are always charged with more or less gold, this item alone, in many instances, will more than pay the cost of this Amalgamator every month. For Circulars, and further particulars, address

Dr. J. B. BEERS, San Francisco.

310 Washington street, San Francisco

NOTICE TO MERCHANTS
AND
MANUFACTURERS.

Moore's Patent Friction Hoist.

Now in successful operation in the principal stores in San Francisco, possesses many advantages over the common Hoist—viz: Greater strength; less danger in working, as goods require no slinging or lashing, consequently make fewer breakages; requires one man less to operate it; stops with the load at any point, without any tugging or attention from the operator.

The undersigned take this opportunity to notify all whom it may concern that they have secured, by letters patent, the application of a friction pawl, or stop, to hoisting machines, and that they will prosecute any party making or using any machine infringing upon the same.

VULCAN IRON WORKS CO.

By Joseph Moore, President.

JOSEPH MOORE.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for breaking or Spalling Quartz, or other Rock, possessing as it does simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:

No. 1.—Or 6 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, only.....\$600
No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour.....850
No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, L, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco. The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I beg to pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who wish to acquire a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON,

Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

For the present it is not intended to grant licenses for the use of the improved German Barrel, for a longer term than two months. If persons desirous of procuring one, without having recourse to legal proceedings, for past infringements or designs of receiving Letters of License for the limited period named, are requested to address as below.

A drawing and full description of this machine, will be found in the Mining and Scientific Press of Sept. 22d, 1866.

JAMES BRODIE, Fulton Foundry, or CHARLES R. BAKER, Express Building, 402 Montgomery street, San Francisco.

WILCOX'S
Patent Steam Water Lifter.

Received First Premiums at the California State Fairs of 1866-7.

Send for Circular.

A Steam Pump without Engine, Piston, Plunger or Packing, using both the expansive and exhaust power of steam, and doing more work with the same amount of fuel, than any other Pump driven by steam power. It is applicable to either lighter heavy work, whether for mining, irrigation, or other purposes. It has been used of various capacities, from 50 to 40,000 gallons per hour, and can be made of any size required. It is not injured by sandy or muddy water. In light of lift it is limited only by the strength of the boiler used.

For further information, apply to M. & A. WILCOX, Proprietors, No. 19 Front Street, between I and J Sts., Sacramento, Cal.

25v15 2am3at

Notice to Miners,
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13-1y Stove Store, No. 125 Clay street, below Davis.

CAUSE OF KEROSENE LAMP EXPLOSIONS.

Kerosene accidents occur from two causes: first, imperfect manufacture of the article; second, adulterations. But a lamp may be filled with bad kerosene, or with the vapor even, and in no possible way can it explode, unless atmospheric air has somehow got mixed with the vapor. A lamp, therefore, full, or nearly full of the liquid, is safe; and also one full of pure, warm vapor, is safe. Explosions generally occur when the lamp is first lighted without being filled, and also late in the evening, when the fluid is nearly exhausted. The reason of this will readily be seen. In using imperfect or adulterated kerosene, the space above the line of oil is always filled with vapor, and so long as it is warm and rising freely, no air can reach it, and it is safe. At bedtime, when the family retire, the light is extinguished; the lamp cools, a portion of the vapor is condensed; this creates a partial vacuum in the space, which is instantly filled with air. The mixture is now more or less explosive; and when, upon the next evening, the lamp is relighted without replenishing with oil, as is often done, an explosion is liable to take place. Late in the evening, when the oil is nearly consumed, and the space above filled with vapor, the lamp cannot explode so long as it remains at rest upon the table. But take it in hand, agitate it, carry it into a cool room, the vapor is cooled, air passes in, and the vapor becomes explosive. We hear much said about dangerous gases being formed in lamps, but this is an error. The whole hazard comes from air-mixed vapor.

But how can we be positively assured of safety in the use of kerosene? How can we know the character of the article offered us by dealers? If consumers are willing to be put to a little trouble, a simple experiment will determine the safety of the kerosene they purchase. Fill a pint bowl two-thirds full of boiling water, and into it put a common metallic thermometer. The temperature will run up to over 200°. By gradually adding cold water, bring down the temperature of the water to 110°, and then pour into the bowl a spoonful of the kerosene, and apply a lighted match. If it takes fire, the article should be rejected as dangerous; if not, it may be used with a confident feeling of its safety.—Exchange.

SPEED OF RAILWAYS.—Dr. Lardner adopts some ingenious arguments or rather illustrations, to render familiar the extraordinary velocity with which express trains move. The Great Western Express to Exeter, travels at the rate of forty-three miles an hour, including stoppages, or fifty-one miles an hour without including stoppages; to attain this rate a speed of sixty miles an hour is adopted midway between some of the stations; on certain experimental trips seventy miles an hour has been reached. A speed of seventy-five miles an hour is about equivalent to thirty-five yards a second, or thirty-five yards between two beats of a common clock; all objects near the eye of a passenger traveling at this rate of will pass by his eye in the thirty-fifth part of a second; and if thirty-five stakes were erected at the side of the road, a yard asunder, they would not be distinguishable one from another; if painted red, they would appear collectively as a continuous flash of red color. If two trains with this speed pass each other, the relative velocity would be seventy yards per second; and if one of the trains were seventy yards long, it would flash by in a single second. Supposing the locomotive which draws such a train to have driving wheels seven feet in diameter, these wheels will revolve five times in a second; the piston moves along in the cylinder ten times in a second—but as there are two cylinders which work alternately, there are really twenty puffs or escapes of steam in a second. The locomotive can be heard to "cough" when moving slowly, the cough being occasioned by the abrupt emission of waste steam up the chimney; but twenty coughs per second cannot be separated by the ear, their individuality becoming lost. Such a locomotive speed is equal to nearly one-fourth that of a cannon ball; and the momentum of the whole train, moving at such a speed, would be nearly equivalent to the aggregate force of a number of cannon balls, equal to one-fourth the weight of the train. That "smash" should follow a collision, is no subject for marvel, if a train moving at such a speed—or anything like such speed—should meet with any obstacle in its progress.—Dodd's Curiosities of Industry.

PAPER WATER PAILS AND BASINS.—The Papier Maché Company on Long Island, make articles of this material which can be used for boiling water, or exposed to severe cold, without injury. They will not rot or rust, will give no taste to their contents, and will keep the said contents cool.

OREGON LAUREL FOR SHIP-BUILDING.—The *Bulletin* gives a letter recently received from George M. Scudder, Ellensburg, Oregon, in reference to Oregon timber suitable for ship building. We quote the portion which speaks of laurel: "Some four or five years ago I had got out at this place (Rogue River) for the navy yard at Mare Island, several thousand feet of laurel—or as it is universally called in Oregon, "myrtle." Most of this would average twenty or more inches squared, in thickness, and was in length from about eighteen to thirty feet; and could have been got out longer, but that the schooner (*Florence Walton*) was not of sufficient capacity; some of the sticks were good crooks, but mostly straight. Several pieces squared twenty-two inches; one, I think, about thirty-two—at least, such can be had. In loading, one of the timbers shipped out of the slings, and being nearly as heavy as lead, sunk to the bottom, and there remained for three years, when ultimately a heavy freshet threw it out upon the river bank. Having been in salt water, worms made an attempt on it, but succeeded only with a slight strip of the sap, the main portion evidently resisting their attacks.

But this is the point I wish to call to your attention. If opportunity occurs I intend sending a part of this to San Francisco. The timber thus seasoned is very solid; my men made a mast from it and daily use it, which is as solid as bone. Laurel or myrtle timber grows plentifully on Rogue River, on the Coquille, Coosue Bay, Umpqua, etc. Growing on river bottoms mostly, considerable of it has been cut off and burned "to clear the land." It is a pity that this, the most valuable timber for ship-building, in my opinion, on this coast, should not be better known. It should be cut—this is a great point—from November to March or thereabouts, and if afterwards "docked," would fully equal any "live oak;" in fact, if, as I think, it will resist the worm, why should it not be superior to any other timber?"

CARD.

THE UNDESIGNED, SINCE DISPOSING OF HIS Gallery on Montgomery street, has seldom been in the street without being asked where the best photographs were taken. Now, for the benefit of his friends and the public generally, he would recommend them to go to the COSMOPOLITAN ART AND PHOTOGRAPHIC GALLERY, No. 521 Kearny street, now owned and occupied by Messrs. HALSEY & SCRIPTURE. Both of these gentlemen are professional photographic artists—one of them having been in the business more than twenty years—and cannot be surpassed by any one in the State.

Persons wishing photographs taken will do well to give them a call. The above named gallery is one of the finest and most convenient in San Francisco, it being situated on the second floor, and its proprietors are the most accommodating and gentlemanly men in the business.

N. B.—Prices as low as at any other Gallery in the city. Solar Printing for the Trade.

Also Stereoscopic Views of California Scenery, at wholesale and retail, at the Cosmopolitan Art and Photographic Gallery, No. 521 Kearny street.

HALSEY & SCRIPTURE, Proprietors.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

Awarded the First Premium at the Paris Exposition.

ADAPTED
FOR
Smelting,
Foundry,
Mining
and
Steamships.

REQUIRES
Fifty Per Cent.
LESS POWER
Than any Blower
now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of Mission and Fremont streets. They are also in use at the Almaden Quicksilver mine; Gridley's Foundry, Gold Hill, Nevada; Etna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirements of the genuine article.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a release of the Patent, bearing date January 9th, 1866

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. JACKSON & SPAULDING.

THE SPRUCE GUM BUSINESS.—It is said that this business amounts, in the State of Maine, to \$50,000 per year. The gum gatherers, with a hatchet and knapsack, make from five to seven dollars a day each. Those used to the business gather say fifty pounds a day. Only a small proportion of this is "chewing gum," worth fifty cents a pound; the rest is "hatchet gum," worth ten cents. It is taken to market with four-horse teams.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. **DRS. BEERS & JESSUP**, corner of Montgomery and Sutter streets, over Tucker's Jewelry Store, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with **ruke gold**—thus restoring them to their original usefulness and beauty.

Call and examine the work. Finest quality of artificial work also manufactured. 16v14-tf

Miners, Visitors to mining districts, R. R. EMPLOYEES, and TRAVELERS generally, should insure against all Accidents in the Traveler's Life and Accident Insurance Company of Hartford before leaving the city.

The American Spring Bed.

THIS BED, NOW SO POPULAR IN THE EASTERN and Western States, was patented August, 1866. For practical utility, comfort and durability, it is unsurpassed. It is easily applied to any bedstead. It is portable, and not liable to get out of order. The price is about one-fourth that of the spring mattress. It combines elegance, with cheapness and comfort. Call and see it. Mechanics' Institute Building, No. 29 Post street, San Francisco. 8v16-3m

"The Excellent"

Will not repair broken limbs nor leaky roofs; but it will quiet the nervous and brace up the weak. It will give more comfort to those suffering from dyspepsia or indigestion than any preparation you ever tasted or heard of. The first physicians use it, and it is made by **BARRY & PATTEN,** 413 Montgomery street, San Francisco. 8v16-3m

HENDY'S LATEST IMPROVED PATENT SELF-DISCHARGING SULPHURETS CONCENTRATOR.

FOR GOLD AND SILVER ORES.

With Revolving Stirrers and Rotary Distributor.

This machine is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators or pretended merit. **THEY ARE WARRANTED TO WORK SATISFACTORILY.**

Directions for Operating Hendy's Concentrators:

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
FIRST—In setting up, set the pan, A, level by the inner rim, near its center.
SECOND—While in operation, keep the Pan, A, about half full of sulphurets.
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

References:

Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:

EMPIRE MILL. (7 Concentrators).....Grass Valley, Nevada County.
NORTH STAR M. & M. CO. (6 Concentrators).....Grass Valley, Nevada County.
NORRIDGEWOCK MILL (2 Concentrators).....Grass Valley, Nevada County.
VALENTINE & CO. Commercial Mill (3 Concentrators).....Nevada County.
HUMBOLDT CANAL CO. (1 Concentrator).....Humboldt County, Nevada.
ROBINSON & McALLISTER M & M. CO. (3 Concentrators) Hunter's Valley, Mariposa County.
PLYMOUTH ROCK MILL CO. (2 Concentrators).....Calaveras County.
MIDAS MILL CO. (4 Concentrators).....Virginia, Montana.
GOULD & CURRY G. & S. M. CO. (4 Concentrators).....Virginia City, Nevada.
VULTURE CO. (3 Concentrators).....Prescott, Arizona.
NOYES & CO'S MILL. (2 Concentrators).....Prescott, Arizona.
LUCY MINING CO. (3 Concentrators).....Owyhee District, Idaho.
MOREY & SPERRY (1 Concentrator).....New York.
GUADALUPE & SACRAMENTO G. & S. M. CO......Sinaloa, Mexico.
EL TASTE CO. (2 Concentrators).....Sonora, Mexico.
B. F. BROWN (1 Concentrator).....Melbourne, Australia.

And in use in many other parts of this coast.

The following give additional proof of the increasing popularity of the machine:

SAN FRANCISCO, October 10th, 1867.

J. HENDY, Esq.—Dear Sir:—To your request for an expression, in writing, of my opinion in regard to the merits of your Concentrator, I reply, that I consider it the best machine for saving quicksilver and amalgam, and for concentrating sulphurets, that I have ever used, or seen used. I may add, that I could give you no stronger proof of this than to order, as I did, six more of them, after a trial of one for several months. I shall take pleasure in showing the machine in operation to any one interested, who will call at the mill of the Empire Company, in Grass Valley. Yours,

S. W. LEE, Supt.

SUPERINTENDENT'S OFFICE, GOULD & CURRY S. M. Co.,
VIRGINIA CITY, Nev., Sept. 17, 1867.

JOSHUA HENDY, Esq., San Francisco:—Dear Sir:—According to the terms under which I secured from you four (4) of your Concentrators, namely—that they were to be paid for only after a thorough trial had demonstrated their value—I desire to inform you that I have tried them, and have found them to work very satisfactorily, and that they will now be accepted by the Company. You will please present the bill for said Concentrators, say \$1,200, at the office of the Gould & Curry Company in San Francisco. Yours, very truly, **LOUIS JANIN, Jr.**

The bill was presented in accordance with the above request, and duly paid.

Four Concentrators have been forwarded to the Vulture mine, in Arizona, which makes eight for that mill. The additional order for four machines was made after a thorough trial, which proved their superiority over all others. [See Mining and Scientific Press of Dec. 14th.]

CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

of geared wheels having a uniform number of teeth, so that when one rotates the other must rotate at the same velocity. E, E' are pistons attached to the shafts, C, C' (one of which is shown in perspective in Fig. 3), and which fit snugly one to each of the bores, a, a', of the cylinder. These pistons may be cast in the same piece with their disks, or they may be otherwise firmly secured to it, and the shaft, C, C', made of wrought iron similar to any machine shaft. The forms of the pistons are nearly half of a ring, the outer arc fitting to its respective bore and the inner one to the hub (as seen in Figs. 2 and 3), and the face, which is

back of its respective bore in the cylinder. The disks also fit snugly against the ends of the hubs, c, c'. The sides of the hubs nearest each other are recessed for the passage

vents the passage of steam between the hub and piston.

B is the induction pipe communicating with the cylinder at the upper junction of the two bores, a, a', and D is the eduction opening communication with the cylinder at the lower junction of the two bores.

To operate the engine as a motor, the steam is admitted to the cylinders between the pistons by opening the eduction pipe, B, and operates on the ends of one and the other pistons alternately, the outer circumferential face operating as an abutment, while the motive force acts upon an end of the other one. Suppose the pistons are in the position as shown in Fig. 2, the steam is first entering at the eduction pipe, and acts upon the piston, E and E', acts as an abutment, and drives E in the direction of the arrow shown upon it, and the gearing attached to it drives E' in the opposite direction, as indicated by its arrow. This action continues until the forward end of the piston, E, passes the induction opening, when the steam acts upon the other piston, E', and produces its continuous revolution, while the continued revolution of E, which now acts as an abutment, is produced by the gearing. The steam acts in this manner upon each piston during one-half of a revolution, thus acting upon one or the other throughout the whole revolution, and escaping in front of the piston by the eduction opening, D, as the spaces in front of the pistons are alternately brought into communication with the opening in their revolution.

Quite a number of engines upon this plan have already been manufactured, of different degrees of power, and where they have been tried have given good and satisfactory results as a motor, and have a greater economy of fuel and steam than the horizontal reciprocating engine.

One of these engines, of a twelve-horse power, and a pump made upon the same principle, was exhibited at the recent Paris Exposition.

This invention was patented in the United States April 10, 1866, and subsequently in Europe, and first illustrated in the *American Artisan* of February 20th, 1867, to which paper we are indebted for the above illustration and description. The inventor is Henry J. Behrens, of the firm of Henry C. Dart & Co., of No. 5½ Pine street, New York, and the patents are owned by that firm, from whom any further information desired may be had.

ASBESTOS—INFORMATION WANTED.—Any person who may know of a locality on this coast where large quantities of asbestos can be readily obtained, and delivered at a reasonably low price, at some point of steam navigation, may possibly profit by communicating the fact to this office. Quantity rather than quality is the object desired. If used at all for the purpose proposed, many tons may be required monthly.

SWEETWATER MINES.—Wells, Fargo & Co. are arranging to run a line of stages to the Sweetwater mines.

Behren's Patent Rotary Engine.

This engine is designed more especially for use as a motor, in which case it may be driven by steam, water, or other fluid; but by having power properly applied to it externally, it may be used as a pump, and this application will be illustrated in a future number of this journal. The pistons are attached to two parallel shafts, and geared together, so as to rotate in opposite directions at the same velocity, and are of the form of segments of rings, made concentric with their respective shafts. Their outer arc-formed surfaces are fitted to and rotate within two parallel laterally communicating bores in the same cylinder or casing, and their inner arc-formed surfaces are fitted to and rotate around two stationary hubs concentric with their respective shafts and bores of the cylinder. The axes of the shaft and their respective bores are situated at such distance apart, and the fixed hubs are so recessed in concave arc-form, that the outer arc-formed face of the piston of one shaft fits the recess in the fixed hub which surrounds the other shaft in such manner as to prevent the steam or water from passing between the piston of either cylinder and the hub of the opposite one. The induction and eduction pipes are arranged in opposite positions where the two bores of the cylinder meet.

In the operation of the engine as a steam motor, the steam acts upon the piston of each shaft alternately, while the piston not operated upon serves as an abutment.

Fig. 1 is a perspective view of the engine, and Figs. 2 and 3 sections of the same showing internal arrangement. In Fig. 4, a perspective view of one of the pistons with its shaft is given. In Figs. 2 and 3, A is the cylinder or casing, having parallel cylindrical bores, a, a', the axes of which are a distance apart equal to about two-thirds of the diameter of the bores themselves, so that the two bores intersect each other, and have a lateral communication; c, c' are fixed cylindrical hubs, which are concentric with their respective bores. The heads of the cylinder are bored through concentrically with the bores, a, a', for the passage of the two parallel piston shafts, C, C', which also pass through and fit concentric bores in the hubs, c, c'. The two shafts, C, C', are geared together by a pair

perpendicular with the planes of rotation of its disk, fitting to work against the face of the disk of the other piston and to the

BEHREN'S PATENT ROTARY ENGINE.

[Written for the Mining and Scientific Press.]

The "Pictured Rocks."

BY PROF. ROWLANDSON, F. G. S. L.

Within even a very limited period, the singular landscape-like appearances presented by several sections of the sand-like rock, now on exhibition in this city, would be placed to the account of one of Nature's freaks. In what follows, an endeavor will be made to explain the phenomena. Before doing so, however, the writer wishes it to be understood that he is neither a botanist or microscopist, and that any reasoning which may follow, based on those sciences, consists in inferences drawn from the observations of others. It will perhaps also be well to remark, that my original impression, as to the singular marking on the sandstone under notice, was made prior to seeing Mr. Fleming's specimens, after several times inspecting a small slab in the cabinet of specimens in the *Alta California* office, on the lower shelf of which is also to be seen a sample of diatomaceous rock, alike, but somewhat coarser in character to the article sold in California as a polishing powder, under the name of electro-silicon; a mineral resembling which, is similarly used in Europe under the name of tripoli. The rock noticed as employed for the purpose of polishing metals, has the appearance of precipitated chalk, sometimes perfectly white, at others, inclining to various shades of buff. The reason for writing the above particulars will afterwards appear.

I have reason to suppose from an explanation made by Mr. Ewer, and referred to editorially in last week's *MINING PRESS*, that the specimen which I first saw, and from which I drew my first inferences, is placed the reverse of its natural position, as the larger part of the slabs now exhibited by Mr. Fleming are so placed, as any visitor will easily perceive on being informed, that the narrow margin of steeatitic bed rock, which is now placed uppermost in most of the slabs exhibited, formed in fact the bed rock on which was superimposed the sands and overlying figures. Examined in the reverse of this position, it will be found that the moss-like appearances and figures, in place of growing and branching upwards, have done so in a downward direction. The downward mode of development just mentioned, is the reverse of our conception of plant-like growth, arising from the fact, which we unwarily overlook, that with all plants some portion, and with some nearly one-half the entirety is developed downwards. Whilst others, as the truffle, for instance, are wholly developed underground. The last instance is introduced with the object of showing to those unacquainted with such subjects, that the lower orders of plant growth can proceed in modes greatly diversified from those which have to be indispensably associated with the growth of *phenogams*, (flowering plants). Another feature connected with the growth and reproduction of *fungi*, to which probably the diatoms are most nearly allied, is their sporadic mode of development, as is well known to pertain particularly to varieties of *botrytes*, as seen in the so-called vine disease and potato-rot.

Possessed of similar sporadic properties, we cannot therefore be surprised to find that where conditions favorable for their propagation exist, the diatoms may be found branching out into something akin to coral-forms, and like corals, each aggregation composed of a vast multitude of separate living organisms. For it must be understood, that the moss-like figures presented in these pictured rocks, are not single plants, but are congeries of innumerable microscopically minute plants, just as the smut in wheat consists of innumerable minute *fungi*. The view just stated is countenanced by the circumstance, that on some slabs, where the sandy particles are coarser than the average, there has probably existed minute pipe-like hollows, subsequently filled up by black patches of diatoms, which, though not lying so closely together as where the more moss-like appearances are to be seen, possess a more massive character, some being the diameter of a grain of mustard. The ramose character of these microscopic organisms is indicated by the fact, that when the sections are cut perpendicularly, their arborescent characteristics becomes plainly apparent, just as

a hushy shrub would appear if bisected through its center, branches being thrown out almost immediately above a very short trunk, the trunk, as it may be termed, being fixed amidst a dark colored layer of the remains of similar diatoms; in fact, the ramose developments presenting a moss-like appearance are merely the downward extension in growth of the ribbon-like and superior layer of pre-existing diatoms. On inspecting the rocks exhibited, since the preceding was written, for the purpose of more minutely examining the phenomena associated with the reversed character in the appearance of the growth of these moss-like representations, I found that all indicated a downward growth where placed amidst coarsish sand, the upward, and that of more stunted development, only being observed in layers found amidst that variety of remains of silicious diatoms already alluded to as tripoli, etc. The inference I drew from the last named fact is, that the dark, carbonaceous-looking diatoms, forming the so often named mossy appearances, belong to a species that luxuriate only in very cold water, in fact, as low and below the freezing point; while the silicious diatoms, the remains of which constitute a favorite material for polishing metals, belong to a variety which is most probably best developed in thermal, or warm water. Thermal water passing over sands heretofore numerously inhabited by what may be termed cold diatoms, would necessarily become dwarfed, as we see is the case on its accession. Some facts on which the above theory is based, will be given next week.

[Written for the Mining and Scientific Press.]

Letter from Idaho.

ROCKY BAR, Alturas County, }
Idaho Terr., Feb. 5, 1868.

EDITORS PRESS:—Your issue of Jan 18th, received to-day, contains the first notice I have seen in your paper in regard to the mines in this region. I refer to an editorial notice headed "Idaho ore." You say, "such ore would do credit to any mine, in any country, and but for the distance which separates these mines from some point of supply, making the cost of transportation so great, they would be ranked among the best ever discovered."

Now, our remote distance is an objection; but it is more than counterbalanced by our extraordinary advantages in the shape of wood, water, and wide, rich ledges. This objection of distance will soon be removed by the completion of the Pacific Railroad, even if the Idaho branch is never built. Even now, freight from San Francisco can be laid down here for eleven cents. It adds but a few thousand dollars additional cost to a quartz mill in the first place, and when once erected the cost in working will be but a few dollars more per ton, while our quartz is superior in richness. Idaho now raises a large portion of her produce, and in two years will have produce in abundance to spare; so that all we will have to buy outside of our limits will be groceries and clothing. We shall soon be able to live here as cheaply as in California, and consequently work our quartz as cheaply as can be done in your State. When that can be done, let California and Nevada look to their laurels as the great gold and silver producing States.

Idaho quartz mines have been terribly abused and slandered; nearly every company has been a disastrous failure, and hence our quartz mines have been pronounced worthless; but the truth is being gradually known, and people are beginning to see and appreciate that the failures of the many companies rest not with Idaho, or Idaho's quartz ledges; but with the companies themselves, and their bad management and thieving, rascally superintendents. We have reached the lowest descent, and I predict that from this time on, Idaho quartz stock will rise, and keep rising; in fact, it is already on the rise. Witness, Owyhee! A year ago the depression there was terrible; even the Poorman was considered a failure;—not a mill was running, and hope was almost entirely crushed out. Now every mill is running, and doing splendidly, and for December Wells, Fargo & Co. shipped \$105,000 worth of bullion—mere nothing to what will yet be shipped from that camp.

Our mines in this county are not inferior, but are superior to those of Owyhee, with the additional advantage of an abundance of wood and water, and a better climate. We have hundreds of ledges here, which, if in California, would sell, with their present development, for enormous sums, and then make the buyers immense fortunes. But we

must have money to develop these ledges, put mills on them, etc., and we naturally look for aid to California; and if you will but come to our assistance, we will repay you a hundred fold. Come and examine for yourselves. Our ledges will bear personal examination and inspection. California capitalists and quartz operators are throwing off on themselves by treating Idaho with so much disdain and neglect. They are losing magnificent chances for investment, and they will soon realize their short-sightedness. There are now several persons from this county in San Francisco, seeking among their friends for working capital for their ledges, and they all deserve success. Messrs. Stevens, Taylor & Taggart have at least two No. 1 ledges—the Grey Eagle and Lucy. I have personally inspected the Grey Eagle; a tunnel taps the ledge ninety-seven feet below the surface, and there is a shaft from the surface ninety-seven feet deep on the side of the ledge, showing a splendid mass of quartz all the way down, and it is over fifteen feet wide at bottom of shaft—prospecting splendidly in both gold and silver. If they succeed in getting a mill and working capital, their fortunes are made. A Mr. Davis is seeking capital for a ledge called the Tahoma, a No. 1 ledge, and he deserves success. Mr. John L. Tilman is also in your city for the same purpose. Mr. T. has several ledges, but the Charlotte Shafer and the Silver Tide I know to be good, and will bear the most rigid inspection. There is no humbug about Mr. Tilden, and he deserves attention. All the above ledges are in the Yuha District, some sixteen miles from here. There may be others in your city, seeking aid. I mentioned the above because I knew they were in San Francisco, and because they are all good men, and have the very best of ledges, and for that reason they have gone where good quartz can be appreciated. Being upon the Pacific slope, and thoroughly identified with its interests, we naturally look for aid from California, and would prefer California capital and men, for they better understand the business, and cannot but help achieve complete successes. I sincerely hope that California capital will begin to flow in the rich channels of investment offered here, and that hereafter our mining region will deserve some notice in your valuable paper.

ALTURAS.

Salt Spring Valley and the Adjacent Region in Calaveras County.

(Read before the California Academy of Natural Sciences, December 16, 1867, by W. A. GOODRICH, Ph. B., Civil and Mining Engineer.)

[Concluded from Page 103.]

The gold and silver from these formations, which have recently attracted so much attention, and have become the object of extensive mining operations at Quail Hill, seem to be distributed at the latter place, to a greater or less extent, throughout the whole mass of the decomposed rock. The surface earth of the hill, also, everywhere contains gold, which may be discovered by washing it in the pan; but this ceases to be the case on the hillsides as soon as the limits of the decomposed rock are passed. Some of the gold, as stated by Prof. Silliman in his communication to the California Academy, already referred to, is quite coarse; but much of it is exceedingly fine and difficult to save in the mill. It is a noticeable fact in the distribution of the precious metals at Quail Hill, that the precious ores and the material in their vicinity have hitherto been found to be always rich in gold and silver, and to contain chiefly if not exclusively the coarsest gold.

The distribution of the gold at Quail Hill is not uniform, the more slaty and ferruginous portion of the decomposed rock, being generally the richest ore, while the compact porphyritic kaolin contains but traces of gold, if any, and some of the other and more compact rock is comparatively poor. The original distribution of the sulphurets here seems also to have followed approximately the same law,—the kaolin containing in general but little trace of their existence, while the more slaty rock is often full of their cavities. Hematite, as well as the hydrated sesquioxide of iron, occurs here in small quantities; and a curious point in this connection is the fact that, while much of the best ore is very highly charged with the hydrated sesquioxide, the hematite has been found hitherto to contain little or no gold. The origin of the decomposed porphyry at Quail Hill is a point of much in-

terest, and it may be a question whether it is not the remnant of an intrusive igneous dyke. The arguments in favor of this supposition consist in the entire dissimilarity in character and structure between it and the surrounding material, as well as in the rarity of porphyry in the region round about. In fact I have nowhere else in this portion of the country seen anything deserving of the name, while the whole texture and appearance of this mass at Quail Hill are precisely such as would have resulted from the decomposition, in place of a true feldspathic porphyry. But however strongly these facts may seem to argue in favor of an igneous origin, it is not easy to reconcile such a supposition with its mode of occurrence here. Other masses of similar character may exist within the hill; but so far as existing developments have cut or uncovered the one of which I speak, the indications are that it is irregular in outline, quite limited in extent, and of approximate lenticular shape. Moreover, in certain places it seems to pass gradually into the eastern country rock, without any distinct line of demarcation, the change in the texture of the rock being even more gradual than the passage from the decomposed to undecomposed material. At certain points but a few feet from the eastern "wall" the kaolin is as perfectly porphyritic in its texture and appearance as in any portion of the mass, while between the two is every grade of passage from the one to the other—the country rock being neither distinctly porphyritic in texture, nor chiefly feldspathic in composition. I am strongly inclined to think, therefore, in spite of its peculiar and distinctive character, that this porphyritic mass is but a local result of the metamorphism of sedimentary strata, which, in many portions of this region, seems to have been as varied in character as it has been high in degree.

The degradation of such formations as this at Quail Hill, has undoubtedly furnished some of the placer gold of the region; but the evidence does not yet by any means justify us in supposing that it has furnished the whole of it. Gopher Gulch, which runs at the foot of Quail Hill, and its branches, for a mile above this point, or nearly to the summit of the Gopher Range, and hundreds of feet above the level of the Quail Hill formation, were in early days rich in placer gold, much of which was very coarse. Other gulches in the vicinity have also furnished more or less gold high up towards the summit of the range. Moreover, the quartz veins which here and there occur in the hard metamorphic rock, are known, some of them at least, to contain gold, and such have probably played their part in the formation of the placers.

I have already mentioned the fact of the prominent association of the precious metals with ores of copper at the Quail Hill mine; but this fact derives still further interest from what follows. As far as my observations have extended in Calaveras County, and also at Whisky Hill in Placer County, wherever gold and silver have yet been found in paying quantities in the decomposed rock formation, there also, or close at hand, are found the oxidized ores of copper, carbonates and silicates; and conversely, I have nowhere seen oxidized ores of copper in this decomposed rock which were not, comparatively at least, rich in gold and silver. It is true that sufficient developments have not yet been made to enable us to state whether this is the general fact, or not. It is possible that the association of these ores may be to a certain extent accidental; but it is not unlikely that it may be otherwise;—and at all events this is a point well worthy of attention and further investigation.

As this finishes my remarks for the present upon the "calico rock" formation, I will close by simply mentioning a point relating to the lower country of Calaveras County, that I have not yet seen publicly noticed elsewhere. The low, rolling hills which form the eastern border of the San Joaquin plain between the Stanislaus and Calaveras rivers, contain extensive beds of horizontally stratified material, which is probably sedimentary-volcanic in origin. The color of these beds is usually varying shades of gray. They contain no pebbles, so far as I have seen; they generally crumble easily and resemble in appearance a friable sandstone. But their grain or grit, which is pretty fine, is also quite clean and sharp as well as hard, and rough-polishes rapidly the hardest steel when rubbed upon it.

These beds are of considerable thickness, and cover many square miles of country. Their stratification has evidently not been disturbed since they were deposited, though they have been largely eroded. The frequent flat tops of the hills, and the level benches, which these beds have produced along their sides, by irregularities of wear, impart a peculiar aspect to the scenery.

Mechanical.

RAILWAY CARS.—The recent terrible railway accidents have attracted very general attention to the study of means for the prevention of such casualties. To accomplish this end improvements are proposed both in the mode of constructing and in the manner in which they are connected when in motion upon the road. It has been observed that in England the cars of a train are attached to each other by means of rigid braces, which are firmly screwed up, so that the train is almost one continuous car. It is thought that this arrangement gives both steadiness and security. It has been suggested that the framework of a car should be constructed of iron tubes—the form in which the greatest strength may be obtained with the least weight. It is also proposed that the covering of the car should consist of very thin boiler iron. Competent engineers estimate that such a car can be constructed at about the same cost as the ordinary wooden car, while it will be greatly reduced in weight, and would last three or four times as long. In case of accident, there would be no danger from splinters which, in case of collision, etc., are found to be most fruitful sources of injury to life and limb. The cars can also be heated by hot water through the iron tubes which will constitute the framework of the superstructure, by which the terrible danger from fire will be completely averted. The public would hail with gratitude any improvements in this direction, that would give greater security to railroad traveling; and railroad managers should leave no expedient untried which gives reasonable hopes of improvement in this direction. Their pecuniary interest, as well as the common cause of humanity, earnestly demands such improvement.

MANUFACTURE OF IRON.—From a paper read by Mr. Fredrick Smith, and recently published in the Transactions of the Institution of Mechanical Engineers, we extract the following notice of the processes gone through in producing the different kinds of iron made at the Rond Oak Works, Eng., and known as "common," "best," and "best best,"—"Common" iron is made from puddle bars from hot-blast mine pig, cut, piled, and heated with best coal for about an hour and a half in one of the bar mill furnaces, and rolled in the bar mill to the section required. "Best" iron is made from a mixture of cold and hot blast pigs, but the top and bottom of the pile are of puddled iron that has been worked over twice at the hammer and forge rolls, so that all "best" iron is worked over at least twice, while the upper and lower parts of the pile are worked over at least three times. "Best best" iron also consists of a mixture of cold and hot blast pig, and is treated nearly the same as "best," only that the whole pile is worked over thrice at the hammer and forge rolls."

TITANIC STEEL.—It would appear from the following paragraph, which we clip from *Engineering*, that Mr. Mushet is still engaged in his efforts towards perfecting the manufacture of titanic steel and iron:

The influence of titanium upon steel and steel manufacture is comparatively little known as yet, but to judge from the records of Dr. Fairbairn's tests of steel, laid before the British Association in the present year, the steel of the Titanic Steel and Iron Company seems to be distinguished by an extraordinary amount of cohesive strength. The specimens of titanic steel tested by transverse strains have given some of the highest figures in Dr. Fairbairn's table, both with regard to the value of the modulus of elasticity, and to the value of the unit of working strength. We do not know whether it be the titanium, but we are quite sure it is Mr. Mushet's great skill as a metallurgist to which such results are due.

The screw propeller is probably as old as the windmill, and a windmill of the construction now usually employed is shown in the egypto-seventh proposition of Hero's "Spiritalia," a work written 140 years before the Christian era.

EXTREMELY HARD STEEL FROM PIG IRON. The London *Mining Journal* refers to an improved discovery which is being matured by two Glasgow gentlemen, a brass-founder and a civil engineer, by which they have succeeded in obtaining steel of extraordinary hardness from pig iron. This adamantine metal, so far as has yet been made public, is produced by placing ordinary pig iron in a crucible, and when brought into a state of thorough fusion certain chemicals are added, which seem to have the double effect of purifying and hardening the metal, when it is run into ordinary sand molds. For the manufacture of files, turning tools, etc., it is expected to be of great value. The editor of the *Journal* had an opportunity of examining a turning instrument made of this singular metal, which has been well used in the turning shop of Messrs. Napier, of Glasgow, and it left the lathe with as fine an edge as when it commenced. Another tool, tried in another shop, is reported to have been kept turning till it acquired a blue heat without receiving the slightest injury. This metal requires no tempering, and when used for turning, the speed of the engine may be greatly accelerated without fraying its edge. The metal has a compact, silvery appearance, but it is too brittle to weld. With regard to what its cost may ultimately be, nothing definite is known; but as yet it is too expensive to be of general commercial utility. This and other evils the inventors are studying to overcome, and they entertain hopes of succeeding. Their invention is protected; and in its present immaturity the public cannot do more than wish them success.

STEEL OR IRON FOR STEAM BOILERS.—A series of comparative experiments designed to test the relative evaporating power of iron and steel boilers was recently made at Hagen, in Prussia, which has elicited considerable interest and discussion among mechanics and engineers. Two boilers, each five feet in diameter and thirty-four feet long, were constructed to stand five atmospheres of pressure. The thickness of the iron boiler was 0.50, and the cast-steel 0.33 of an inch. These boilers were set alike, filled with the same quantity of water, and the fires fed alike with weighed fuel. After several experiments the fires were extinguished, and, at a low temperature, the water was drawn off. The result of the experiment showed the evaporating capacity to be 17-20 per cent. in favor of the steel boiler.

It was thought by some that the greater evaporative quality of the steel boiler was due to its thinness and greater density than the iron one. The more dense the metal the better the evaporative quality. Others thought that the method of manufacture of the plates of the iron boiler had some influence. If those plates were rolled from blooms they were, no doubt, homogeneous, but when they were made from bars of iron cross-piled, welded, and then rolled out, they were formed, as it were, of sheets cemented together, and often prevented from adhesion by strata of dirt or foreign matter. This would affect the evaporative quality of the plates.

GALVANIZING IRON.—The process of galvanizing iron, as practiced in one of the leading establishments of Philadelphia, is as follows: Selected sheets of iron, after being trimmed to requisite size and cleaned by a weak acid solution, are rolled smooth, then dried in an oven and each sheet placed in contact with zinc. Both metals are raised to an equal heat and thus fusion is effected. The regulation of the heat necessary to metallic combination is a point of nicety and care.

CAST PORCELAIN.—Something entirely new in the manufacture of porcelain has recently been introduced in a Philadelphia factory. The new material is called "hot-cast porcelain," for while containing the ingredients of which porcelain is composed, it is worked like glass, and like the latter it can be blown, pressed or rolled into any desired shape.

LEAD AND ZINC are greatly expanded by heat—the latter nearly two and a half times as much as wrought iron, under equal temperatures.

Scientific Miscellany.

ELECTRICAL.—A singular phenomenon was observed recently at the Rochester office of the Atlantic and Pacific Telegraph Line. One of the wires was down between that place and Syracuse, when suddenly it was discovered that neither wire would work. It was then perceived that a continuous current of electricity exhibiting rainbow colors, was passing, although the batteries were detached. The gas in the office was lighted by holding the end of a connecting wire near the burner; and the current was sufficiently intense to scorch the fingers of the operator. This continuous current was broken up into an undulating one when the key was opened, and again made continuous at will.

The Rochester Union gives the following explanation of this phenomenon:

"The theory advanced by an experienced electrician is this. The electrical equilibrium of the atmosphere had become disturbed by the sudden and extreme cold of the past two days—and we may say here that this phenomenon has never been witnessed except when cold weather prevails extensively—the electricity, instead of descending to the earth as in a thunder storm or in warm weather, ascends in the atmosphere, thus destroying the equilibrium and producing these magnificent displays. The broken wire spoken of, which rested on the ground, was the point of communication for the current from the earth. The electrician advances the theory that Aurora Borealis is produced from the same causes, and we submit that it is not an improbable theory. Every one has seen, undoubtedly, the wavy or undulating motions of the Aurora Borealis, and the wavy motions of the current last night with the batteries off and the key open were precisely the same.

NEW GALVANIC BATTERY.—Boetger has constructed a galvanic battery of such constancy that it retains its activity for several years, and is admirably adapted to working electric clocks and for all purposes where constant galvanic action is desired. Each cell consists of a cylinder of thick plate zinc enclosed in a glass jar. In the center of the cylinder is placed a bar of compact coke, and the intervening space is packed with a powder composed of a mixture of equal volumes of pulverized sulphate of magnesia and common salt, moistened with a saturated solution of these two substances. The salt mixture is moistened from time to time, and the zinc carefully connected with the coke, according to the usual method.

HEAT WITHOUT COAL.—Recent scientific discoveries should do much to lessen the alarm of those who fear the exhaustion of our coal fields. Mr. H. W. Pond, of Newark, N. J., remarks that economists have speculated on the possible discovery of some method of producing heat independent of coal, and the decomposition of water has been regarded as a probable expedient. With our present knowledge and appliances it appears not to be difficult to realize this proposition, even in competition with coal—at least in a small way. The agents are obvious—wind-power, a magneto-electric machine, for the decomposition of the water, and oxygen and hydrogen gas-holders. The result would be that oxygen and hydrogen would be available for the production of the heat which would be required. For use in the arts the oxy-hydrogen furnace would, of course, offer advantages far above any other known, and results could be reached impossible with the lower temperature of the coal fire, while the flame would be free from deleterious substances common to coal. Owing to its gaseous form, and the intensity of its heat, this fuel would be manageable in many ways impracticable with coal. For instance, seams could be hard-soldered with great rapidity with the jet of the compound blow-pipe, and it is probable that the joints of steam boilers could be heated for welding in a suitable oxy-hydrogen jet.
